Connected with the indicator that shows the state of the roadbed under the rails is an arrangement which sprinkles blue paint on the track so that the trackmen can tell at once where repairs are needed. Another indicator takes care of the distances, making a little dot every ten seconds, which shows by its relation to the other lines made by the other indicators, the exact location of every imperfection in the track, and it does this so exactly that the division superintendent can tell within a couple of feet where every imperfection is. The record made on paper is on the scale of one-eighth of an inch, and of course a chart of a hundred miles of road is of an immense size. It is from this that the repairs are made, but a condensed chart is also figured out from this, which shows the general condition of the whole section.

These maps are very interesting. The perfect road is indicated by a heavy line drawn through the middle of the chart. Where the rails are new and heavy, the line of the indicator will follow this closely, diverging from it only in slight and gentle waves, but the instant the car comes upon a section where the rails are old, that fact is recorded by great jagged angles on both sides of the line. The dynagraph never draws a perfectly straight line, because of course no rail ever can be made absolutely without imperfections, and also because there is a deflection under a heavy train of from two to three feet in a mile for a ninety-five pound rail. This is as close to being perfect as any road ever comes. This machine has been in use on different roads of the country for about fifteen years, during which time it has shown many facts which have been of the greatest service to manufacturers of rails.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

RISDON IRON WORKS,

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of tires will crush from 1200 to 1600 tons.

One set of tires will crush 1500 tons.

One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to stirring, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 4-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager,
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, Esq., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. McIVER, President; D. CUSHMAN, Secretary,
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 14, 1895.

In the useful metals there is a general withholding of orders that keeps prices from advancing; with the precious metals there is more steadiness. The silver quotations which are remarkably steady, do not indicate anything except that the smelting contracts with New York agencies and the London market cover so much of the bullion product as to virtually control the market till the close of the year. Probabilities are that early in '96 will see a marked advance in the white metal. The net imports of tinplate during '94 were 387,185,601 pounds; with the total domestic production of 193,801,073 pounds, the approximate consumption in the United States foots up 580,986,674 pounds. The annual capacity of mills that were completed on the 30th of last June is 450,000,000 pounds. With the mills in process of construction completed the annual capacity would be 570,000,000 pounds, within 10,000,000 pounds of the present annual consumption.

Though aluminum does not enjoy as much of an industrial "boom" as was prophesied for it some time ago, it occupies considerable prominence. There are three grades of commercial aluminum, with present New York quotations as follows:

No. 1 aluminum (guaranteed to be over 98 per cent pure) in rolling ingots—54 cents per pound in small lots; 52 cents per pound in 100-pound lots; 50 cents per pound in ton lots.

No. 1 aluminum (guaranteed to be over 98 per cent pure) in ingots for re-melting—52 cents per pound in small lots; 50 cents per pound in 100-pound lots; 48 cents per pound in ton lots and over.

No. 2 grade (guaranteed to be over 94 per cent pure aluminum, with no injurious impurities, for alloying with iron and steel) cast in ingots for re-melting—50 cents per pound in small lots; 48 cents per pound in 100-pound lots; 45 cents per pound in ton lots and over.

Aluminum castings are quoted at sixty cents per pound upward, in accordance with the number of castings, their weight, cost of molding, etc. The prices of castings of aluminum hardened with other alloying metals, the same as for pure aluminum castings. Hard aluminum castings can be furnished with a tensile strength of at least 30,000 pounds per square inch. The shrinkage of aluminum is a little more than that of brass, being 17-64 of an inch to the foot.

Finely powdered aluminum for paint, printing and other purposes (made by grinding beaten aluminum), called in the trade "Aluminum Bronze Paint," $2.25 per pound; lots of 100 pounds, $2.00 per pound; varnish for aluminum bronze paint, $1.25 per gallon.

To obtain the weight of aluminum in castings, bars, sheets, etc., divide the weight of similar pieces of copper by 3.3, brass by 3.1 and steel by 2.9.

To obtain the relative cost of aluminum sheet to copper, brass and steel sheet, multiply the cost per pound of the copper sheet by by 3.3, brass sheet price by 3.1 and steel sheet price by 2.9.

Mining Share Market.

SAN FRANCISCO, November 14, 1895.

The depression in the market has continued throughout the week, and it looks as if this will be the rule for some time to come or until after the Hale & Norcross suit is out of the way.

Several assessments were levied the past week. Others are to follow before the close of the year. The work as now outlined in about every one points to a good many months before anything of a substantial character will be brought to light; yet the work done will be in the nature of putting the mines in a much better condition for working after they find and develop a large body of good to high grade ore.

From the Comstock mines both private and official advices continue of an important character; yet it points to further time before anything deserving of notice is brought to light. While exploiting several of the mines ore is extracted, but not in sufficient quantity to cover current expenses. Some of the ore runs up to around $75 a ton, and if the stringers now being followed should develop into a lode several feet wide dividends could be looked for, but instead of widening they pinch out. In the Alta group the work is in an advanced condition, and it should not cause surprise if quite a body of good ore is developed. Everything at present points in that direction; yet it may take more time than expected by those in position to know. In the Gold Hill group work is being done in a lifeless, half-hearted way, as if the managers feared the money would give out too soon and they could not collect assessments fast enough to pay current expenses. Even as it is, the assessments come fast enough. The past week Confidence and Yellow Jacket were assessed. These will be followed by others in that group. The work being done in these mines should not be ignored. It means before the first half of 1896 passes by quite an ore development, but whether a stock deal can be promoted on it is problematical. It certainly can not until moneyed insiders come in and do it. They are still pushing west in Seg. Belcher, Belcher, Crown Point, Yellow Jacket, Confidence, Challenge, Con. Imperial and Alpha. This work is being closely watched, for if properly done it is confidently expected that better results will follow than has for many years; yet many months may pass by before this can be known with any degree of positiveness.

In the middle group ore extracting continues, but not on a sufficient scale to attract attention. The small leads which are being followed are not of sufficient importance to justify any movement, outside of manipulation, in the share market. It now looks as if work will have to be pushed lower down before anything of importance will be found and developed. In Gould & Curry and Best & Belcher the work continues of a dead character—getting the mines into good condition for more advantageous working next year. In Con. Virginia the work on the 1000-foot level gives promise of better things than have been brought to light for many years, yet time and money will be required in prosecuting the work. An assessment will probably be a necessity. In Ophir and Mexican the work on the upper levels and also on the 1465-foot level is being done in a fairly active way; still it looks as if the managers are trying to avoid finding an ore body. Perhaps such an event might frighten them so very badly that life might be despaired of. In Union and Sierra Nevada the work being done is of an interesting character, yet it looks as if considerable more time will be required before anything of importance is found.

In the outside districts nothing of importance is being done outside of the Bodies. Our advices from this district are quite important and indicate that before next spring they are liable to uncover enough ore to re-oew dividends by at least two of the mines.

The following illustrates the changes of the week:

Assessment Notices.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of November, 1895, an assessment (No. 59) of twenty-five cents (25 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the ninth (9th) day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

CONFIDENCE SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 13th day of November, 1895, an assessment (No. 26) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 414 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 8th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. S. GROTH, Secretary.

Office—No. 414 California street, San Francisco, California.

Assessment Notices.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1895, an assessment (No. 46) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine street, San Francisco, California.

SUPERIOR MILL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placerville, El Dorado county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the fifth day of November, 1895, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 916 Market street, Room 81, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and un ess payment is made before, will be sold on WEDNESDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. HOWARD BARNARD, Secretary.

Office—Room 81, 916 Market street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the second day of November, 1895, an assessment (No. 1) of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the second day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the fifth day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 Twelfth street, San Francisco, California. Office hours from 4 to 6 o'clock P. M. Bring your certificate.

THE JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the ninth day of November, 1895, an assessment (No. 7) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of December, 1895, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 6th day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 2) of three c nts per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Rooms 37 and 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 16th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—37 and 38 Crocker Building, San Francisco, California.

IOWA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 23d day of October, 1895, an assessment (No. 21) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of November, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 16th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. THOMAS, Secretary.

Office—Room 2, 419 California street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 77) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of December, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DERRICK.—Orange M. Loveridge, Weaverville, Cal. No. 548,375. Dated Oct. 22, 1895. The object of this invention is to provide a derrick which is adapted, by reason of its adjustable boom, to easily reach and to be connected with loads close by the mast, and as far out as the length of said boom directed horizontally from the mast. This adaptability, in conjunction with the extension of the boom, makes it possible for a large radius of ground to be worked over without having to move the derrick, thus adapting the device for the particular use of raising large rocks and boulders out of hydraulic mines. A further object is to provide a derrick the swinging boom and the hoisting mechanism of which may be readily operated, the latter at different speeds, and the various parts may adjust themselves without cramping. To attain these objects the boom is pivotally connected with the mast and is provided with operating mechanism whereby it is moved to various points through an arc in a vertical plane, thereby throwing its upper end, from which the load carrier is suspended, to different points in vertical planes. The boom is also extensible by means of novel construction.

Fig. 1

AMALGAMATOR.—Rodney Wing, Butte, Montana, assignor of one-half to Jonathan C. Baker of same place. No. 548,792. Dated Oct. 29, 1895. The object of this amalgamator is to provide a simple and effective device for amalgamating gold and to catch quicksilver, said device being adapted for use in gold and silver mills, or in connection with concentrators, or for saving fine gold in gravel mining. The amalgamator consists of a pan, the body of which is composed of longitudinal and transverse electroplated or quicksilvered plates set on edge and fitted together to form independent vertically disposed cells, said plates terminating short of the bottom of the pan and having on their lower edges shelves adapted to catch the material and increase the contact surface, and facilitate the distribution of the material over the bottom of the pan. By the use of this pan all the material, especially the slimes and the water which contain float gold, quicksilver or amalgam, must come a number of times in contact with the amalgamating surfaces while passing through the machine, and this, assisted by the motion which is imparted to the pan, increases the amalgamating effect, thereby increasing the saving of floating gold, quicksilver, amalgam, or any precious metals susceptible of amalgamation, held in suspense during the process of wet milling of gold or silver ore, or sluicing in gravel mining.

BUTTER MOLDING AND CUTTING MACHINE.—Rufus A. Simpson, Ferndale, Cal. No. 548,821. Dated Oct. 29, 1895. The object of this invention is to provide an apparatus for the cutting of masses of butter into rectangular blocks having a given weight, such as is used in marketing and retailing the butter. It consists of a box having removable sides and bottom, into which the buttor is packed; means for dividing the butter, both horizontally and vertically to form packages, and removable bottom boards having a width equal to the thickness of the rolls; means for removing cutter-head so as to separate the butter resting upon the adjacent bottom board, after which it may be withdrawn and the bottom boards allowed to drop from their position. In conjunction with this mechanism is a transversely slidable carrier having vertical cutting wires extending from side to side and adapted to separate transversely the packages successively from the mass within the mold.

DENTAL MOUTH MIRROR.—Frank L. Platt, San Francisco, Cal. No. 548,817. Dated Oct. 29, 1895. The object of this invention is to provide a dental mouth mirror capable of holding the lips apart, holding the cheek away from the molar teeth, retaining a napkin in the cheek and on the tongue to assist in keeping the teeth dry, acting as a shield to the lips and cheek to prevent their being wounded by the use of other instruments and keeping the tongue away, said mirror being so bent with respect to its handle as to avoid interference with the hand with a full and free transmission to and reflection of light from its surface when in use, and being also provided with a guard for its protection against injury from the corundum wheel. The invention consists in a handled mirror, provided on each side with a wing or flange adapted to hold the lips apart and to retract and hold the cheeks away from the molar teeth. These wings or flanges are the essential feature of the mirror. Other features are the shape of the mirror and handle, the relative positions of the two, the shape and location of the wings or flanges, a radially adjustable and removable guard for protecting the face of the mirror from the stone in grinding the crowns, and an easily applicable guard for the tongue.

ADJUSTABLE SIGHT FOR FIREARMS.—Frederick W. Dohbell, San Francisco, Cal. No. 548,801. Dated Oct. 29, 1895. This invention relates to that class of firearm sights commonly known as "peep" sights, and in which the sighting aperture is formed in the center of a comparatively large disk adapted to a vertical adjustment upon the standard in which it is mounted. The invention comprises a mechanism including a slide having a fixed indicator or mark, and a disk thereon having range graduations on its face, to be brought into alignment with the mark or indicator on the slide, said disk being rotatable to effect the range adjustment of the sight, whether said sight be a peephole in the center or a sight aperture independent of, though moved by, the disk, or both. It also comprises a means by which the disk may be initially adjusted to bring its graduations to proper coincidence with the fixed lines or pointers whereby they are read. The chief object of the device is to provide for the rapid, smooth and accurate adjustment of the sight to the several ranges, and which may be conveniently operated by the thumb of the right hand without aiming the gun. Other objects are to provide for proper adjustments to enable graduations, to register accurately, and also to provide the combination of two sights, one of which may be used for target shooting and the other for hunting, and both of which are readily adjustable.

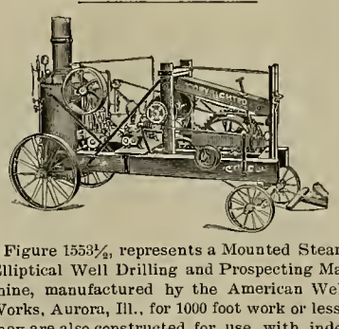

Figure 1553½, represents a Mounted Steam Elliptical Well Drilling and Prospecting Machine, manufactured by the American Well Works, Aurora, Ill., for 1000 foot work or less; they are also constructed for use with independent Steam, Gasoline or Horse Power; will handle as successfully and rapidly the Hydraulic, Jetting, Rotary, Cable, or Pole drilling tools, making it one of the best all-purpose drilling machines manufactured.

Every owner of a traction engine should have one of these machines, with which he can make a larger per cent of profit for capital invested than in any other way.

The manufacturers would like to correspond with any parties who wish to purchase a really practical machine.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice. There are delinquent upon the following described stock, on account of assessment (No. 37) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.
M. J. McDonald, Trustee	294	5,000	$100 00
M. J. McDonald	453	250	25 00
M. J. McDonald, Trustee	451	2,825	282 50

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on November 2, 1895, the above sale is postponed to MONDAY, the 2d day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

GIRARD WATER WHEEL.

34 MAIN ST. SAN FRANCISCO, CAL.

Highest Efficiency and Accurate Regulation.

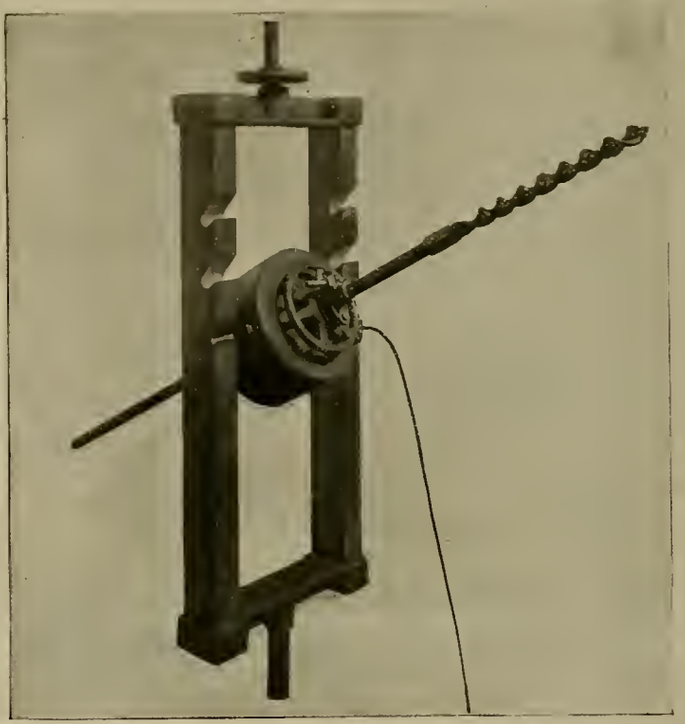
MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 21. SAN FRANCISCO, SATURDAY, NOVEMBER 23, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

An Electric Mining Plant.

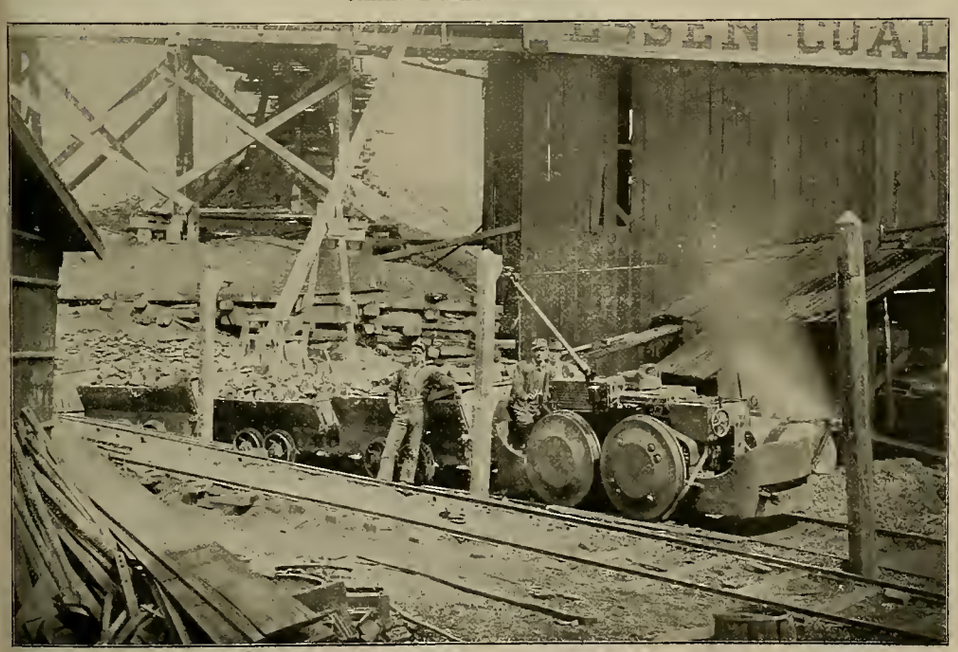


Pennsylvania occupies the same pre-eminence in coal mining that California does in gold mining. When the mining world wants to know what is the latest and best method and apparatus for gold mining these columns are culled; so, when up-to-date information is desired about coal mining we look to a Pennsylvania mining journal for information.

Interesting to all underground workers, whether for gold, silver, copper or coal, is an account of an electric mining plant recently installed by the Link Belt Machinery Co., in No. 2 and No. 3 mines, of the Essen Coal Co., at Hazeltine, near Pittsburg, the largest plant of the kind in the United States. D. N. Osyor, the mining engineer of the Link Belt Machinery Co., superintended the work of installation.

One of the accompanying illustrations depicts one of the two 80 H. P. locomotives coming out of the mine. These electric locomotives are used for the principal haulage; the primitive mule is still depended on for motive power in gathering and other lighter haulage. The locomotives attain a speed of about eight miles an hour, exert about 3800 pounds drawbar pull and can daily haul 1200 tons of coal a distance of 3500 feet.

The chain breast machines, or "Independent" coal cutters, are sixteen in number at present. Each cutter is two feet high, 2 feet 4 inches wide and 10 feet 5 inches long, cutting a depth of five feet. The frame is steel and wrought iron; the sockets, socket pieces and chain are cast steel. Power is furnished the coal cutter by a 20 H. P. motor wound for 250 volts with one field coil. By an ingenious lever attachment the cutter can be reversed, stopped or fed forward without stopping the motor.



The Gearless Electric Drill is an important part of the plant, and, as previously described, performs effectual service. It is evident from the result that the point sought has been attained, viz.: sufficient power so directed as to make the cost of delivering the coal on board the railway cars such a figure as would admit of profit in the face of the fiercest competition. The Pennsylvania coal miner is handicapped as compared with the California gold miner; here there is no competion, transportation of the refined product cuts no figure; the world is the market; there is but one price; every particle procured is eagerly sought after; it requires no advertising or solicitation. In the case of coal, in such a region as western Pennsylvania and eastern Ohio, where coal is delivered at $1.00 per ton, such adverse conditions prevail as to render necessary the closest economy to keep in operation. The fact that the plant briefly noted here fills such rigid requirements is sufficient evidence of its practical utility.

GEARLESS ELECTRIC DRILL.

CHAIN BREAST MACHINE.

LOCOMOTIVE COMING OUT OF MINE.

Being asked "What is the outlook for steel rails, since that is the largest single channel of consumption for steel?" Andrew Carnegie says: "The railway system of the country is practically developed. We can never expect again to build railways at the rate of 13,000 miles a year. There are more rail mills than will ever be employed on rails, and some that never should have been built. The rail mills must now adapt themselves to other purposes as well as rails. No doubt the consumption of rails next year will be greater than it has been for two or three years, but not sufficient to keep the rail mills all busy upon rails." An opinion from another point of view is now in order and would certainly be of equal value.

Nothing better illustrates the present activity in the mining world than the springing up of so many new mining papers. Every week come two or three new candidates for popular favor. From Oregon is received four new publications, each devoted primarily to mining intelligence. In this, as in other departments, accuracy and reliability are essential, and should be made the prime factors in the enterprise. The city dailies, especially the *Call*, are also devoting increased space to the mining interests of the State, all of which helps to advertise our mineral resources and aid in the general good.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gearless Electric Drill; Locomotive Coming Out of Mine, 333. A New Tubular Hub, 339. The Electric Locomotive and Freight Train Leaving the North Exit of the Tunnel, 340.

EDITORIAL.—An Electric Mining Plant: The Outlook for Steel Rails; The Present Activity in the Mining World, 333. Mr. Johnston's Plan; Mining Activity at Cripple Creek; Neglect of S. F. Business Men to Take Hold of Mining Properties; "Deep Level" Mining in the Rand, S. A.; The Monometallic League; Celebration at the Eisenzecher Mine, Siegen, Germany; The Rights of Tunnel Locators, 334. California Mineral Products, 335.

SCIENTIFIC PROGRESS.—A Cure for Burns; Measuring Starlight; The Mills' Steel Process; The Keely Motor, 339.

MECHANICAL PROGRESS.—A New Tubular Hub; Maxim's Flying Machine; Commercial Aluminum, 339.

ELECTRICAL PROGRESS.—Electric Locomotive Performance; Big Electric Scheme; Protection from "Live" Wires; Electric Light Company in Pennsylvania; A Big Suit, 340. The Danger Line; The Standard Telephone Co., 341.

PRACTICAL INFORMATION.—No More Solid Shot; "How?" and "Why?" The Female Wage Earner; Strychnia and Anti-Toxine; The Polariscope and Its Uses; World's Oldest Wooden Building; To Remove Putty; Petroleum for Consumption; The Rusting of Iron Poles and the Rotting of Wooden Ones; A Steamer on Rails; Durability of Chalk Marks; To Transfer the Outline and Tint of a Leaf; A Good Substitute for Gutta Percha, 341.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 342-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 350.

MISCELLANEOUS.—Notes on Gold Milling in California, 336. Reasonable Geology; 'Twould Be a Foot Higher; Male Population of Voting Age; Comments of a Prospector; Aluminum Bronze, 337. Concentrates, 338. Coast Industrial Notes; Personal; Commercial Paragraphs, 344. Notices of Recent Patents, 346.

THE plan suggested by Geo. Johnston in last week's issue of settling the mineral land question is commented on by a prominent officer of the California Miners' Association as "a business basis of settlement of an ordinary business question by business men." Two bills with the same intent were introduced at the last session of the 53rd Congress, one by Congressman Caminetti, the other by Senator White; neither got any farther than the committee room.

IN the flush days of timber location and purchase in Oregon and Washington, in '87, '88 and '89, it was not uncommon for a little paper, started with a hand press and a hatful of type, to have in its third or fourth issue seventy-five or eighty notices of application to purchase timber land, for which it received $10 each. The fourteenth issue of the Cripple Creek *Mail* to hand has 104 applications for patents for mining claims, which indicates considerable mining activity in that region.

TO THOSE who argue that mining is only ephemeral, and not to be regarded as a permanent industrial feature of any locality, is commended notice of the recent celebration at the Eisenzecher Zug mine, near Siegen, Germany, of the four hundredth year of its continuous working. It was opened in 1495, and has been almost steadily operated ever since. If there is any one permanent, abiding industry on the face of the earth, or in the crust thereof, it is mining. The Siegen mine owners, in step with the progress of the age, have resolved to discard present primitive appliances and will put in a modern plant, to work and light the mine by electricity. When, iu 2295, the eight hundredth anniversary is celebrated there will doubtless be further development of natural forces that will make our nineteenth-century mining operations seem primitive as viewed through the haze of the centuries.

IN another column, "Prospector" has some sarcastic remarks about the neglect or inability of San Francisco business men to take hold of promising mining properties. While every proposition offered is not eagerly embraced, it is doubtful if there is another city in the world of any size where a larger proportion of the business men resident therein have investments in adjacent mines. It is often the fashion through the years to sneer at San Francisco's slowness to invest in mines, and occasionally there is some foundation for scoffing on the part of those who fail to interest capital; yet, through the years, it is noticed that San Francisco business men have usually stood ready to invest in mining propositions and to carry many a good man with a good mine till he was able to carry himself.

THE monometallic league or "sound money" advocates, who desire to influence public opinion through the press, continue to send us weekly brochures showing how the country is in danger of being ruined unless Messrs. Cleveland, Carlisle and the other members of the bond syndicate save the nation from the machinations of the wicked silver miners who are interested only in securing a market for their accursed silver and who care nothing for the prosperity of our beloved country. Indeed, the only real patriots are the gentlemen who buncoed Uncle Sam out of $10,000,000 in the recent bond deal. Among the closing sentences of the last "expose" of these bad silver men to hand is this gem: "Our country really is not interested iu silver except that a very few of our people are engaged in mining." This excerpt is given as a sample of the kind of stuff supplied by "the sound currency committee of the Reform Club; publication office, 52 William street, New York." The sentence quoted needs no answer. It illustrates how little those who sent it out understand the question they attempt to discuss. The constant reference to "silver barons," and the silver output of Nevada, etc., shows also the belief (which is generally shared in the East) that the Comstock was and is purely a silver-producing proposition. The official report published on page 342 of this issue is sufficient answer to that; in that report, Superintendent Lyman of the Con. Cal. and Va. M. Co. gives the eutire yield of that mining company's property to October 1st, 1895, as aggregating $131,425,074.33; and of this amount $69,753,805.92 was silver, and $61,672,168.41 was GOLD. The proportion of gold and silver on the Comstock was a very fair one. Nature there made a just effort in the direction of bimetallism, and the Supreme Intelligence which created that metallic deposit of the two metals seemed to understand the currency requirements of humanity better than the sound currency committee of the Reform Club of William street, New York.

MUCH has been written of "deep level" mining in the Rand, South Africa, district. What may, however, justly be styled "deep level" mining is well exemplified in gold quartz mines in this State, among others the Champion and Providence mines in Nevada county. This week the shaft in the latter mine has attained a depth of 1800 feet. There are many deeper shafts on this coast, some in the State of Nevada a thousand feet deeper, but the one mentioned is a good illustration of profitable gold mining at great depth. At the depth of 1780 feet a drift has been run 600 feet on the front ledge, which is six feet of heavily sulphuretted ore. A crosscut run 400 feet on the back ledge at the same depth shows a ten-foot ledge of equally good ore. On the 1350-foot level ore yielding free gold is being worked. Sulphurets increase with depth. This mine is not specially mentioned as an isolated or unusual case. It has been worked for over twenty years, has yielded millions, and recent indications show it good for as many more years and millions. Here, in California, it is taken as a matter of course, nothing unusual or wonderful; there being many more just such properties. Were one or two of these big gold producers showing great ore values at 1800 feet depth in other States or countries, they would be advertised and heralded as something great and unexcelled, and the attention of the world called to the fact. In the Golden State, where the usual is not contrasted with the occasional, the Providence is simply viewed as a phase of the business; in some places the gold is placer, and to be hydraulicked; in others drift, cement capped; in others in the quartz at great or little depth, but nothing to make a fuss over. It has sometimes, however, seemed that maybe it would be better for California to give greater prominence to such great permanent gold producers as the Providence (which, by the way, is not on any list, nor is there any stock for sale). Eastern press comment and Eastern letters evince a general idea that California is a by-gone factor in the gold product, when as a matter of fact it can be quietly said, without the slightest exaggeration that California is to-day foremost in gold mining and milling methods, is supplying the rest of the gold mining world with the brightest, brainiest mining men in every department, and that the $1,500,000,000 or $1,600,000,000 that California has added to the gold output of the world bears the same relation to the amount of gold within her borders that an index does to the volume whose contents it indicates.

REFERENCE was made in last week's issue to a recent Colorado decision affecting the rights of tunnel locators, regarding which further inquiry has been made. The case referred to was the Rico-Aspen. The Enterprise Mining Co. owned the group tunnel and tunnel site in Dolores Co., in which was discovered a blind vein not known to exist when the tunnel site was located. The vein was called Jumbo No. 2. The Rico-Aspen Con. Co. owned a surface lode claim, the Vestal, which ran parallel to the line of the tunnel, its nearest corner being over 300 feet distant. The course of "Jumbo No. 2" was almost at right angles to the tunnel line, and, after crossing the Vestal claim extended into the Jumbo claim, also owned by the Enterprise people. In July, '87, the Group tunnel was located; the tunnel had been run 400 feet when the Vestal was located; application for a patent to the latter was made in 1890 and patent issued in February, '92. At the time of application, "Jumbo No. 2" had not been discovered, the date of its discovery being September 1, '91, through a shaft 800 feet from the tunnel line, the tunnel being then in 1500 feet. In June, '92, the Jumbo vein was cut in the tunnel 1920 feet from its mouth. The Enterprise claimed "Jumbo No. 2" because of its tunnel location, discovery and subsequent location: the Rico-Aspen, owners of the Vestal, claimed it because of location and prior discovery within their limits. The court ruled that the owner of the tunnel was the owner of the lode within the Vestal claim. The court's decisions were to the effect that the locator of a tunnel site has the right to the possession of every blind vein or lode which crosses the line of the tunnel within 3000 feet from its face, that was not known to exist when the tunnel was located, contingent only upon the diligent prosecution of the work on the tunnel and the discovery of the vein or lode therein: that a discovery of such vein or lode from the surface and a location thereon, after the location and commencement, of the tunnel, will not deprive the owner of the tunuel of any part of the vein which he covers by his surface location made after his discovery of the vein in the tunnel, if he has diligently prosecuted his work on the tunnel: that the owner of such tunnel is entitled to 1500 feet along such lode or vein, and this length may be taken up, having as many feet as he desires upon each side of his point of discovery in the tunnel: that the owner of a tunnel claim when a blind vein or lode has been discovered in the tunnel should adverse and litigate the application for a patent by the owner of a surface lode claim covering the same vein or lode. When, however, it is manifestly impossible for such owner of a tunnel claim to know that the blind vein exists in his tunnel, or, if discovered, that it is within the territory of a surface lode claim for which a patent is applied for, he will be excused from adversing such patent application, and he will lose none of his rights by such failure: that to entitle the locator of a tunnel site to blind lodes which he may discover in running his tunnel—he must push work on his tunnel diligently. He cannot cease work for six months or for one month and then recommence: work must be prosecuted on the tunnel diligently, and if it is not, rights to veins or lodes in the tunnel, discovered after the owner ceases to prosecute work diligently, are forfeited, and they may be located from the surface by others: he has no right to any vein or lode which was discovered before he located his tunnel, or, which, undiscovered, lies within a properly located lode claim that was located before the location of the tunnel site and the commencement of work upon it, and that there is no authority given by the statute to the locator of a tunnel site to run his tunnel through a lode claim properly located prior to the location of his tunnel site and the commencement of work upon it, whether the lode claim is pat-

ented or not. This matter has been ruled on by a California court and substantially to the same effect, the circumstances in the two cases being sufficiently similar to make the litigation and result almost identical.

California's Mineral Products.

The mineral products of this State in '92 aggregated $16,000,000 in value; in '93, $18,806,261; in '94, $20,203,294, a good showing for "dull times," and the best comparative showing of any industry in this State or on this coast.

Following is a table by counties of the gold and silver product of California for 1892:

County.	Gold.	Silver.	Total.
Amador	$1,210,383 45	$8,007 99	$1,218,391 44
Butte	316,998 50	610 00	317,608 50
Calaveras	794,531 31	24,441 32	818,972 63
Del Norte	4,102 00	...	4,102 00
El Dorado	198,321 54	...	198,321 54
Fresno	106,987 00	6 00	112,987 00

Tuolumne	354,734 72	1,392 50	356,084 22
Yuba	30,839 27	...	30,839 27
Totals	$12,422,811 60	$537,157 77	$12,959,969 37

It will be observed that the gold product of 1893 was $149,088.97 less than that of '92, and that the silver production of '93 was $274,607.31 more than that of '92. The gross yield of the combined gold and silver was $125,518.34 more in 1893 than in '92. In '93 the increase and decrease by counties of their gold and silver production is shown by the following table:

County.	Increase.	Decrease.
Amador	$292,813 10	...
Butte	...	$ 4,754 36
Calaveras	850,342 12	...

Yuba	107,480 20	...	107,480 20
Unapportioned (2)	32,568 06	388 91	32,957 57
Totals	$13,923,281 89	$297,331 55	$14,220,613 44

(1) Based on returns at San Francisco mint.
(2) "Unapportioned" includes product of single mines, etc., in counties, so as to conceal their identity; and also includes estimates of product of properties known to be working, but from which no returns were obtained.
Counties not mentioned in this third list ('94) made no returns for 1894.

The above tables are compiled from official statistics from the U. S. Mint and State Mining Bureau and are as exact as careful effort, extensive inquiry and intelligent co-operation can make them. It is believed that complete returns from all the 57 counties of the State—31 of which are represented above—would largely augment the sum total. The figures are the result of months of correspondence and patient effort to get at least an approximate statement. In every instance the total is rather under than over, the idea being to make quantity secondary to accuracy.

It will be noticed that the gold product of this State was $149,008.97 less in '93 than in '92; and that the gold product of '94 was $1,351,381.32 more than in '92, an increase of $1,500,470.29 over '93. It is believed that the gold output of the State for the current year will show an aggregate of between $15,000,000 and $16,000,000. In 1894 the increase and decrease by counties of their gold and silver production, in comparison with '93, is shown by the following table:

County.	Increase.	Decrease.
Amador	...	$179,107 73
Butte	$160,818 51	...
Calaveras	455,233 72	...
Del Norte	...	2,352 00
El Dorado	71,233 61	...
Fresno	1,083 21	...
Humboldt	...	25,213 75
Inyo	57,859 62	...
Kern	264,987 19	...

Yuba	76,640 93	...

Bulletin No. 7 of the California State Mining Bureau, though tardy by reason of delay in the State Printing Office, contains very complete tables of the mineral products of the State for '94 in excellent form. The mineral wealth of the State, metallic and non-metallic, is well illustrated by this chart. So far as possible, every county in the State is credited with everything of a mineral character produced within its borders in '94: Alameda produced 468 tons manganese, worth $4962; 44,450 tons salt, worth $125,125; 7500 M. brick, worth $37,500; 59,642 tons macadam, $73,463; 1625 cu. ft. building stone, $1000. Like other foremost mining counties beside its yield of gold and silver, Amador added other wealth—15,280 tons coal, worth $23,020; 2500 tons pottery, worth $3000; 25,941 cu. ft. marble, worth $35,826. Besides being first in the yield by counties of gold in '94, Calaveras mined 115 tons of mineral paint or ocher, worth $2530, and 654,866 pounds copper—72 to 82 per cent—worth $64,951. Colusa, with gold mines patented to agricultural claimants by specious testimony, only returns 20 M. cu. ft. building stone, worth $7500: Contra Costa mined 35,000 tons coal, worth $94,000: El Dorado burned 10,000 barrels lime, $8000, and produced 1800 squares slate, $11,700: Fresno reports 216 tons coal, $700, and 500 tons gypsum, $4000: Humboldt, 20,000 gals. mineral water, $7200; 148,686 tons rubble rock, $199,240. Inyo shows 900 M. pounds lead, $27,000; 1,161,400 pounds borax, $81,298 (New York price); 1530 tons soda, $20,000; 12,500 cu. ft. marble, $62,500: Kern. 92 tons antimony, $3720; 6900 tons asphaltum, $138,000; 11,215 barrels petroleum, $69,334; 33,000 barrels lime, $26,500. Lake produced 12,471 flasks of quicksilver of 76½ lbs. each, worth $382,954: Los Angeles Co., beside a little gold, produced 1134 tons gypsum, $11,340; 475,650 barrels petroleum, $617,065, a product that will be more than doubled this year; 7500 M. brick, $37,500; 9500 barrels lime, $10,800; 11,000 cu. ft. building stone, $5500.

Besides its gold yield, Madera quarried 48,858 cu. ft. granite, worth $31,494; Mono mined 50,000 lbs. lead, $1500. Napa yielded the most quicksilver of any county, 9705 flasks, $298,016; 1440 tons magnesite, $10,240; 97,275 gals. mineral water, $41,231; 51 tons infusorial earth, $2040. Nevada, third on the list as a gold producer, sent out 290 tons copper paint, $5800, and 83,728 lbs. copper, $7535. Placer, which has second place in the gold counties, also produced 22,000 tons pottery, $27,500, and 65,119 cu. ft. granite, $66,700. Riverside, besides doubling its gold yield of '92, produced 7891 tons coal, about enough in quantity to supply San Fraucisco for twelve hours, worth $16,142; 1981 tons salt, $3962; 24,000 cu. ft. granite and 24,000 bbls. lime. Sacramento is credited with 11,250 M. brick and 75,000 cu. ft. granite. San Bcuito produced 1005 flasks quicksilver, $30,861; 58 tons antimony, $2280; 762 tons gypsum, $9144; 40,000 bbls. lime, $44,000. San Bernardino produced the most silver; 10,378,699 lbs. borax, $726,509; 1000 tons salt, 8000 bbls. cement, $21,600; 31,000 cu. ft. granite, 40,000 bbls. lime, 5000 tons of stone for flux and beet sugar manufacture. San Diego shows 700 tons salt, 50 tons asbestos. San Joaquin, 55 tons manganese, and a number of cu. ft. natural gas that represents a value of $75,000. San Luis Obispo produced 800 tons concentrated chrome, $10,500; 9432 tons bituminous rock, $32,263; 500 cu. ft. California onyx, worth $20,000. Santa Barbara mined 4550 tons asphaltum, worth $91,000. Santa Clara, 7235 flasks quicksilver, worth $222,169; 5009 gals. mineral water, 80,000 cu. ft. natural carbonic acid gas, 3500 bbls. petroleum, 22,725 M. brick, and 24,000 cu. ft. building stone. Santa Cruz, 20,782 tons bituminous rock, 167,000 bbls. lime. Shasta, apart from its gold, 1200 tons chrome, 200 tons iron, 150,000 gals. mineral water, $75,000. Siskiyou, 100 ounces platiuum, $600, the only county in California yielding that metal. Sonoma, 100 tons red oxide of iron paint. Ventura, 290,913 bbls. petroleum. Nearly every one of the 57 counties of the State contributed in some degree to the mineral wealth total.

Summarized, the total value of the metallic product of the State for '94 is as follows:

Metals.	*Value.*
Gold	$13,923,281 89
Silver	297,331 55
Quicksilver, 30,416 flasks	934,000 00
Chrome, 3,680 tons	39,980 00
Mineral Paint, 610 tons	14,140 00
Antimony 150 tons	6,000 00
Copper Cement, 738,594 pounds	72,486 00
Iron, 200 tons	1,500 00
Lead, 950,000 pounds	28,500 00
Manganese, 523 tons	5,512 00
Platinum, 100 ounces	800 00
Total	$15,323,331 44
Non-Metallic Substances.	
Borax, 11,540,099 pounds	$ 807,807 00
Coal, 59,887 tons	139,862 00
Magnesite, 1,410 tons	10,240 00
Mineral Water, 402,275 gallons	184,481 00
Salt, 49,131 tons	140,087 00
Asbestos, 50 tons	2,250 00
Gypsum, 2,446 tons	24,584 00
Infusorial Earth, 51 tons	2,040 00
Soda, 1,530 tons	20,000 00
Total	$ 1,331,351 00
Hydrocarbons and Gases.	
Asphaltum, 11,698 tons	$ 233,800 00
Bituminous Rock, 31,214 tons	115,193 00
Natural Gas, 80 M feet	79,072 00
Petroleum, 783,078 barrels	1,064,521 00
Total	$ 1,492,586 00
Structural Materials.	
Clays and Hydraulic Cement	$ 513,798 00
Granite, 312,365 cubic feet	228,816 00
Lime, 373,500 barrels	318,700 00
Limestone, 15,420 tons	19,275 00
Macadam, 441,867 tons	369,438 00
Paving Blocks, 2,517 M	66,981 00
Rubble Rock, 219,993 tons	295,400 00
Building Sandstone, 79,125 cubic feet	30,792 00
Concrete Sandstone, 18,000 tons	82,800 00
Marble, 38,441 cubic feet	98,326 00
Onyx (California), 500 cubic feet	20,000 00
Slate, 1,800 squares	11,700 00
Total	$ 2,056,026 00
Grand Total	$20,203,294 44

Notes on Gold Milling in California.

NUMBER II.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

The guides, which direct the drop of the stems, are in two sets, upper and lower—the former above the tappets, and the latter below the cams—and are bolted to the guide girts by eight bolts. They are best made of hard wood, but pine answers sufficiently well—though the former lasts five times as long as pine. The old style guide consists of two pieces of 4-inch plank 14 inches wide, planed on all sides, and of sufficient length to fit easily between the battery posts, with equi-distant semi-circular grooves, fitting together, for the passage of the stems. A quick and exact way to make these grooves is to clamp the two planed planks tightly together as they are to be placed on the frame, set them on edge, and, after marking off the centers for five stems, bore out the circle (using the joint line for the point of center) with a long-handled auger having an adjustable bit. These are kept in many mills for this special purpose.

Before bolting the guides in place, half-inch pieces are placed between the two halves, and adjoining each stem, which are planed down later as the guides wear, leaving but little play for the stem. After boring out the grooves for the stems, and before putting the guides in place, they should be lubricated. A convenient and economical plan is to cut some semi-circular pieces of thin sheet iron of a somewhat larger diameter than the grooves, and drive them into the wood at both ends of the channel; then lay the halves level, groove side up, and fill the latter with linseed oil, letting them remain until the wood has taken up all it will absorb, when the remainder is returned to the can, and the sheet iron pieces removed.

If, in a pin guide, those portions occupied by the grooves are cut out square, and hardwood bushings fitted in before boring out, the stem will work parallel to the wood fiber, which reduces the friction, and lengthens the life of the guides; while only the hardwood bushings would need replacing, making the cost of the guides less.

The great drawback to these guides is that when a stem has to be removed the entire battery has to stop; hence the adoption of separate guides for each stem, being either all iron or wooden bushing in iron frames, which are held in place by wedges and the lips of the iron frames.

For the support of the stamp stems when suspended wooden latch fingers, or jacks, are supplied. A jackshift, three inches in diameter, rests in bearings attached to the inner sides of the battery posts; on this, cup-shaped sockets ride, in which the wooden fingers are attached, shod at the upper end with an iron plate ¼ inch thick, and provided with an iron or leather "hand-hold" near the top.

For the greater convenience of quickly removing and replacing stems, or cam shafts, large mills are supplied with overhead travelers, or "crabs," in line with the batteries, in connection with a chain block and tackle running on plates secured to the roof, shod with iron tracking. To easily reach the cams, tappets, etc., a platform is placed just below the cam shaft.

The feed floor consists of a double board floor of 1-inch lumber, with broken joints, supported on joists 18 inches apart, and about 2 feet below the feed opening in the mortar.

The grizzly is a coarse screen consisting of a number of parallel bars attached to a frame, set on an angle from 45° to 55°, over the ore bin. These bars may be of round, rectangular, or V-shaped (apex down) iron, or of wood, faced with iron, and resting on several iron cross rods, held apart with iron washers; the distance between the bars should be equal to the opening the rock crusher jaws are set to—from 2 to 3 inches. There are no fixed dimensions of length or breadth, as these depend in a measure on local conditions; but they are usually from 3 to 6 feet wide, and long enough (12 to 15 feet) to give the fine material time to drop through the spaces before reaching the crusher floor.

Where substantial steel T rails are used for tracking in the mine, they can be made to serve for grizzly bars, when no longer of use in the mine, by turning them with the base up.

The grizzly should be placed at the highest point of the mill over the ore bin, where the car or wagon can enter and dump. Its chief object is to separate at once the finely divided ore from the coarser; a secondary purpose is served in affording an opportunity to recover drills, gads, or hammers that may have come from the mine, in the ore, before they reach the rock breaker or mortar. Its lower end rests on a platform in front of the rock crusher, or, better, in a chute with an adjustable end gate placed above the mouth of the rock crusher, so as to permit of its being fed automatically.

Where the ore as delivered from the mine carries less than 5 per cent of fine stuff the grizzly should be dispensed with, especially where, in constructing the mill, fall must be economized. Some object to the use of the grizzly as tending to feed all the hard rock by itself, and say the output of those batteries is below the others.

Rock breakers or crushers are placed on a platform below the grizzly and above the ore bin in such a manner that the crushed rock mingles with the fine stuff passing between the bars of the grizzly. The rock breaker must be of sufficient weight to remain firm in its place, and strong enough to resist heavy strains; the dies should be easy to exchange and adjust, and all parts requiring to be oiled should be arranged to prevent oil coming in contact with the quartz. In large mills it is best to have one crusher to supply every twenty stamps, and on account of their intermittent work they should have driving power separate from that of the stamps.

Rock breakers are adjusted to crush the rock smaller than the throat of the mortar (therefore, less than 3 inches), but as the work of the rock breaker is cheaper than that of the stamp it would pay, with very hard rock, to do more of the crushing with this machine, even to the extent of placing two crushers, one beneath the other, and bringing the quartz greatly reduced to the stamps.

There are two general types of rock crushers. The older pattern carries a flat, fixed jaw, working with one having a reciprocating motion and using flat or corrugated dies that are reversible. The Blake is representative of this pattern. The other pattern has an outer, circular, fixed jaw, within which a corrugated jaw circles, of which the Gates is the representative. This latter machine permits of larger blocks being fed. It is an excellent machine for heavy work, and where the rock is not wet or clayey; but it requires greater horse-power, for where a Blake, 10 by 8 inches, crushing 3 tons per hour, requires 9 H. P., the Gates, with a diameter of 37½ inches, crushing 3½ tons per hour, requires 16 H. P. The Gates consists of a nearly vertical shaft of forged steel, rotated from below by a beveled wheel set ½ inch out of the center, on the top of which a chilled iron conical head is attached, with the base downward, rotating within chilled iron concaves, with an outward slope, set in the cylindrical body of the machine. Between these two faces the ore is crushed, their distance apart below being gauged by set screws. The shaft, by being made to revolve around an eccentric at the bottom, has a constant crushing power without doing any grinding. A set of concaves last two years, and can be replaced; the center shaft with the chilled iron head has been known to crush 120,000 tons of an average hard quartz before wearing out.

Ore bins should always be as spacious as the surroundings will permit, but never of less capacity than will carry a twenty-four hours' supply for the mill, say about 65 cubic feet to the stamp. They are usually constructed with a sloping bottom, to facilitate discharging, but where very large bins can be erected this feature is not so essential. These bottoms must be solidly braced and ought to be covered with iron plates over those portions where the ore has to be dropped. The front of the bin is parallel with the mortars and supplied with gates for each battery above the level of the hopper of the self-feeders. These gates should be regulated by a pinion and rack, and set for a regular discharge and delivery, through chutes, into the self-feeders. The chutes should be lined with heavy sheet iron.

Self-Feeders.—The entire value of the stamp battery hinges on a regular and even feeding, and as it can be done much better (from 15 to 20 per cent) by a machine than by hand, this latter method has become well nigh extinct in California. Among the mechanical feeders most used are the Challenge (in two patterns), Tulloch, Stanford, and Roller feeders. Although the three latter are very serviceable for certain classes of ore, and are cheaper in first cost, the Challenge is undoubtedly the best all-round machine, which is proved by its almost universal adoption. They are either placed on a frame which runs on an iron track in the feed floor, back of and at right angles to the battery, or are suspended from tracks supported by the battery posts and standards placed against the ore bin. This latter pattern permits of greater accessibility to the feed side of the mortar. In general, the Challenge feeders consist of a hopper with a movable circular plate beneath, set slightly inclined toward the mortar, receiving a rotary motion by means of gear wheels acting on the lower face of the plate, which are moved by a friction grip that receives its impetus from a blow of the descending stem on a bumper rod connected with it. Movable wings extending from the point of the hopper over the plate toward the throat of the mortar permit a given quantity of the ore to be scraped off at each blow through a partial rotation of the plate. The older machines were made with right or left-handed humpers, but the present and better plan is to place the rod in the center, so that the third stamp in a five-stamp battery imparts the blow. The newest machines have no bumper rod, but are worked by a collar fastened on the stem above the top of the mortar. Each battery is supplied with its own self-feeder.

The Tulloch feeder consists of a square frame, into which a hopper fits, having below a tray suspended from the frame at any desired angle, and in such a manner as to have a forward and backward swinging motion inside the frame, which can be arrested on the forward motion at a certain point by lugs, underneath the tray, striking a bar. The back of the hopper is supplied with an adjustable scraper, and at each motion of the tray a certain amount of the ore is scraped forward and falls into the battery. The machine is operated by the descent of the stamp.

Mortars.—The mortars in California are mostly single discharge, and cast in one piece, extremely solid. When required in places inaccessible by wagon roads they are cast in pieces, which are later bolted together. Their interior form depends on the nature of the ore, and the procedure to be applied; thus we find them made with narrow or flaring, deep or shallow troughs, and with or without inside plates. Mortars with narrow troughs are made for greater output, while a wide trough assists battery amalgamation, and gives opportunity for placing inside copper plates. In some of the newest styles of mortars a series of grooves are furnished in the lining plates, to contain quicksilver. The mortars weigh from 4000 to 6500 pounds, the bottoms being made extra heavy; in some of the latest patterns the bottoms are 8 inches thick. The length varies between 4½ and 5 feet, and the height from 4½ to 4½ feet. The inside width of the trough corresponds with that of the foot plate of the dies. A heavy flange, 4x3 inches, is cast on the base of the long sides, in which are four holes on each side for bolts, to secure the mortar to the block.

The difference in design hinges chiefly on the different opinions of leading mining men as to the method and value of amalgamating inside the battery.

The Hayward mortar is a full-lined mortar, with flaring trough, weighing, complete, about 6500 pounds, without any special arrangements for inside amalgamation.

The Alaska mortar is a full-lined mortar, with flaring trough, in which the linings are furnished with grooves, to contain quicksilver.

The Wilman mortar was the first attempt at inside amalgamation, using an inside removable copper plate, but this failed to work well; the copper plate, being so close to the shoe and die, scoured, and could not retain the amalgam. In remedying this defect the Pacific mortar was produced, in which the copper plate was placed higher up, under the feed throat; experience in the working of which suggested changes that finally evolved the Union mortar, which is provided with a copper amalgamating plate, 12x48 inches, bolted in a recess at the back of the mortar, reaching below the level of the screen opening. This plate is removed on clean-up days to be scraped, and then replaced. Similar good results have been obtained by the writer in using a double discharge mortar and filling the back discharge opening with a plank instead of a screen, to which a plate, 8 inches wide and the length of the opening, has been attached.

A modification of this back plate arrangement is noticed in a mortar designed in Milwaukee, Wis. The back plate is accessible, from the back of the mortar, through a covered opening; it is secured in place by a dovetailed key at each end, allowing it to be adjusted to the varying height of the dies.

Dies.—They consist of a cylindrical body of the same diameter as the shoe, with a square foot plate with broken corners, and should fit loosely against the front and back plates of the mortar. The broken corners permit their easy removal. They are cast both in iron and steel.

Shoes.—They are made of iron or steel, and consist of a cylindrical body of the same diameter as the stamp head, with a cone-shaped neck, half as wide as the cylindrical body, and about 5 inches long. The weight of the shoe bears a certain relation to the other parts of the stamp, generally about one-sixth of the total weight when made of chrome steel, but somewhat less when made of iron. The cylindrical portion of the shoe is somewhat longer than the corresponding part of the die, on account of its greater wear—the latter being protected by a cushion of quartz. Both shoe and die are used until worn as thin as possible; with the shoe this may be ½ inch, though rarely, while the die is worn to the foot plate, if not fractured previously. This practice is not to be commended, and should only occur in case of necessity. On stamps weighing about 900 pounds the shoes, if of chrome steel, weigh about 150 pounds, and if of iron weigh about 20 pounds less, and are about 9 inches in diameter. The life of the shoes depends on the nature of the quartz and the height and speed of the drop, but as a general rule shoes and dies of steel last as long as two and a half sets of iron ones, and cost twice as much. In the matter of choice between steel and iron, the proximity of the mill to foundries is of consequence. Steel shoes and good iron dies usually work very smooth, but where the waste iron can be disposed of at a foundry this metal is preferred for both.

Reasonable Geology.

NUMBER V.

By FREDERICK DANVERS POWER, F. G. S.*

When a few things resemble each other in many properties, so that we are led to believe what we know of one is true of another, it is a case of analogy. Reasoning by analogy is always an uncertain guide, and we can never be sure that we are arguing safely; all we can say is, that when two cases are similar in many respects, it is probable they will resemble each other in other points; and that the more points of similarity there are between them, the more likely we are to be right. There are many minerals almost peculiar to certain localities, so that by their characteristics one can at first sight name the place where they were found, such as the celebrated iron glance crystals from the Island of Elba, the piuk fluorspar of St. Gothard, and the pink apophylite from St. Andreasberg, etc. There is, so far as we know, no reason why similar specimens should not be found elsewhere; still it remains a fact that by studying rocks and minerals one can frequently name the birthplace of a specimeu. The early gold buyers of Australia could almost invariably name the locality of a parcel of gold, even if it were attempted to mislead them by a false statement.

A man in one locality may become thoroughly conversant with the lodes of his district, aud able to form a correct judgment about them, though he might find it difficult to put his reasons and arguments into words; he may even have gone so far as to determine the cause of the deposit. If placed in another country and told to search for similar lodes with which he is acquainted, he would naturally reason from what he had learned in his little corner of the earth, and if he found the productive veins to run east and west, and the barren ones to course north and south, he would be apt to pay attention to the former and ignore the latter, although circumstances might be so altered in the new place that the position of the productive veins were reversed.

The antecedents of a deposit in one instance are not always necessary for its production in another, and certain indications—*e. g.*, the presence of particular minerals, which are considered as favorable in the one case, might be just the opposite in the other. We must use provisional generalization, for as Herbert Spencer says—"If we waited till all the facts were accumulated before tryiug to formulate them, the vast unorganized mass would be unmanageable." At the samc time, we must guard against the abuse of generalization. To frame an hypothesis that cannot be verified, or to neglect its verification, leads to no result or to a fallacy, and this is why so many persons have such a strong antipathy to what they call "theory." An hypothesis must have at least two different facts; it may, however, agree with several observed facts, and still be wrong. Before deciding to accept it as true, we should test it in every conceivable way, and when possible verify it with our senses. It was owing to au hypothesis agreeing with certain observed facts and traditions that made our forefathers believe Noah's flood to be universal. From all countries we hear of extensive floods, and we find fossil remains of sea shells even on the tops of mountains. What more do we want? On more thorough examination the dates of the floods are found to be vague, or not to tally, and even at the present day we have extensive floods in all quarters of the globe. Then, again, the fossils are found to belong to various formations of different periods, and if we push the subject still further we discover that there is not enough water in connection with our globe to cover our hills, and if there were, the rapid subsidence of such a body of water is inconceivable.

When an hypothesis agrees in several of its results, and when by its help we are enabled to predict certain things, such as we would not otherwise have discovered or expected, theu we may he almost sure that the hypothesis is correct. It was in this way that certain of our elemeuts were predicted and discovered by thoughtful men who noticed blanks in the tahles constructed from the periodic law. J. A. R. Wewlands predicted the discovery of Germanium. Mendelejeff predicted Gallium, also Scandium; the latter, which he named Ekaboron, was discovered to exist by Nilson in 1879. Uneducated miners often ask what good theory is to a geologist, and state that we seldom hear of a geologist discovering a valuable deposit, and that for every one a geologist finds the so-called practical miner—in other words, the pick-aud-shovel man—finds a score. No doubt this is true, and he might add that out of the score, nineteen were discovered by accident, and in many cases by persons—not always men—who had never done any mining before, or given the matter a thought. I have before me several examples of mines which originated in the unthinking action of a child, horse, duck, wombat, etc., and also of cases where the practical miner has looked away from valuable minerals, and passed on by the other side.

*London Mining Journal.

When we consider the small percentage of geologists in the world compared with that of miners, and further take into account that very few of these devote their time to prospecting, it is no longer wonderful that we hear so little of finds by geologists. Many geologists are only sent to the field after a discovery has been made, and as soou as their inspection is over they have to leave to carry out other work without an opportunity of endeavoring to find new deposits. Mr. S. F. Emmons made a thorough investigation of the Leadville district, Colorado, for his monograph on those deposits. As a result, he tendered certain advice to the miners; those who took it profited by it, hut those who refused and thought they knew better, found out their mistake to their cost.

Many predictions have been made as to the presence of certain minerals in different localities which have been subsequentiy verified. R. J. Murchison (Q. J. G. S., Vol. VIII, page 134, and "Siluria," third edition, page 489) prophesied the occurrence of gold in Australia; he made a slip, however, when, relying on the knowledge of auriferous deposits gained in the Urals, he said that we need not expect gold below a certaiu defined limit. Geologists often have this thrown in their faces; but those who always like to look on the worst side of things forget that Murchison was always ready to acknowledge his mistake, and corrected it in subsequent writings. Professor T. W. E. David, of Sydney, foretold the presence of coal under that city; last year the 10 foot seam was struck by a bore at 2929 feet—*i. e.*, within 30 feet of the depth David had calculated, which we must consider very good, as there was nothing to guide him nearer than 20 miles away. (*Engineering and Mining Journal*, Vol. LVI, page 630.) In 1816 Mr. N. J. Winch forecast the occurrence of salt in the Tees valley, and it was discovered there in 1859. (T. G. S., Vol. V, page 543.) Captain Nichols found iron deposits in the Mesaba helt, Minnesota, in 1890, which had been predicted by the State Geologist and his assistants in 1888. (The Mesaba Iron Range, T. A. I. M. E., 1892.) Many similar instances are known to geologists which I need not repeat here.

Reason declares that which is hid from ordinary observation, or, as Dr. Robert Ball puts it—"When observation fails, our reason steps in and adds greatly to our information." Surely it is more manly to try and find out the causes of phenomena we see around us than to be satisfied with substituting a synonym for a reason, or evade the investigation by assuming a cause we do not understand, concluding that there must be some connection between two things we are almost ignorant of. Any one who descends to such deceptive reasoning, which, if he thinks, he must know is wrong, can have but little faith in himself or his conclusions, and had better join the ranks of those who believe in the obvious fallacy that if a little knowledge is a dangerous thing, a great deal of knowledge is still more so.

'Twould Be a Foot Higher.

Two men were sitting in front of the store discussing the financial situation. One was an out-and-out free silver man and the other a monometallist.

The silver man was demanding free and unlimited coinage, while the gold man insisted that all this silver talk would amount to nothing.

A third man drew up a chair, and, after listening quietly for a while, spoke up, saying, "Maybe you're right 'bout all this silver talk 'mounting to nothing, but I'm a silver man and I'm of the opinion it's going to tell. It's just like this:"

The two disputants settled themselves comfortably, and the third man continued:

"There was a certain farmer in the Kansas cyclone district who was building a stone wall. He was putting it there to stay, building it five feet 'cross the base and four feet high. A stranger came riding by aud seeing the care the farmer was taking, said to him, "You seem to be mighty careful about that wall."

"'Yep,' replied the farmer, 'I'm er building her to stay.'

"'T'aint no use,' replied the stranger; it'll blow over just the same.'

"'Wall, let her blow over, she'll be a foot higher if she does,' replied the farmer, continuing his work."

The gold man lighted his pipe.

THE United States census of 1890 shows a total male population of voting age of 16,940,311, of which persons of foreign birth number 4,348,459, and those of native birth 12,591,852. The aggregate white population of voting age is given at 15,199,856, 10,957,496 native born and 4,242,360 foreign born. Of the uative male voting population 8,807,223 are the sons of native parents, while 2,150,273 are born of foreign parents. The total colored population of voting age was 1,740,455. The voting population of the eight largest cities is as follows:

	Total Voters.	*Native.*	*Foreign.*
New York	446,798	177,729	269,069
Chicago	331,593	133,109	198,484
Philadelphia	307,274	191,785	115,489
Brooklyn	225,607	112,666	112,941
St. Louis	130,056	73,450	56,606
Boston	137,910	74,179	63,731
Baltimore	116,658	86,797	29,861
San Francisco	116,350	41,146	75,204

Comments of a Prospector.

TO THE EDITOR:—At the recent California Miners' Convention, under the spell of environments, and inspired by the magnetism of the men from the mountains, Mr. Hugh Craig, president of the Chamber of Commerce, and in the name of the merchauts of Sau Francisco, welcomed the Miners' Convention, and admits that "our State and our city owes a vast debt of gratitude to the miner." Boldly he asserts: "Gentlemen, we are with you in this mining business;" he even invites the miners, "when you come to the city with a good mine, just let us in on it; that's all we ask."

What a happy change of condition and views must have taken place, or occurred, these last few weeks! The miners are glad to notice this return of confidence on the part of San Francisco merchants (how about bankers and others?); they are delighted, and somewhat astonished, too, to be asked by San Franciscans "to be let in" when the miners can offer a fair show of some taugible evidence of a profitable mine, quite willing to divide with their San Francisco comrades the wealth to be brought to the light of day by their joint efforts.

So far, so good. But what is, or, let us now say, what has been, the experience of a prospector coming to this city, during these long years, with an offer of a favorable prospect, with some specimen and hope of assistance to open a ledge, or at least to determine by some work its value and extent? If unknown, they were not even listened to; if known and with good reputation, they were listened to by courtesy, and then politely informed of the inability (a suitable word for indisposition) to do anything whatever in that line. And this, mark you, not merely with merchants, professionals or those engaged in industrial pursuits, aye, even with mining men and those who gained their competency, if not wealth, through mining operations or mining deals. Another thing to mark is this: Not mere prospects, or surface scratchings, or outcroppings, with a few holes here and there, were offered and refused; no—ledges where shafts 100 feet deep, or tunnels and corresponding drifts have been run; where the surface ore of the pay shoot had paid, sometimes, extraordinary expenses; where there was wood, water power, sometimes ditches and flumes already at hand; where unforseen or extraordinary circumstances had prevented a continuance of operations; where the incompetency or negligence of the owners, or the insufficiency of adequate meaus and appliances, resulted in loss of gold when the rock was milled. Were such not sufficient inducements and reasons, at least to those who "ask to be just let in on it," to secure their active and practical cooperation? Thus far it had not been the case.

But the voice of the merchants was heard, and their words are recorded; and let us hope that the Half Million Club will perceive that, with a languishing mining industry, an over-hurdened agriculture, and a too often unprofitable horticulture, their efforts would be in vain, and that San Francisco, with all her advantages, could not attain for a long time that eminence to which she seems to be destined. Actual deeds must be equal to good intentions and friendly professions of all those who can see in the united pull of miners, farmers, industrials and merchants, together, the dawn of another era of prosperity for city and State, which, under proper conditions and guidance, are manifestly destined to become stars of the first magnitude.

PROSPECTOR.

Aluminum Bronze.

Aluminum and copper form two series of valuable alloys—aluminum bronze, containing from two to twelve per cent of aluminum, and copper-hardened aluminum, containing from two to fifteen per cent of copper. The five to twelve per cent alumiuum bronzes are among the densest, fiuest-grained and strongest alloys known—alloys having remarkable ductility as compared with tensile streugth. The alloy of between ten and eleven per cent of aluminum with copper is the "true aluminum bronze," and is the way the alloy should be first made, the lower bronzes being made by dilution of teu per cent bronze with more copper. The teu per cent bronze can be made in forged bars with 100,000 pounds per square inch tensile strength, with 60,000 pounds elastic limit per square inch, and with at least ten per cent elongation in eight inches; and aluminum bronzes can he made to fill a specification of even 130,000 pounds per square inch and five per cent elongation in eight inches. Such bronzes have a specific gravity of about 7.50 and are of a light yellow color. The five to seven and a half per ceut aluminum bronzes of from 8.30 to 8 specific gravity, and a handsome yellow color, readily give 70,000 to 80,000 pounds per square iuch tensile strength, with over thirty per cent elongation in eight inches, and with an elastic limit of over 40,000 pounds per square inch. It will probably be alloys of the latter character.

istics that will be most used, especially in bronze wire and for marine work, and the fact that five to seven per cent bronzes can be rolled or hammered at a red heat, proper precautions, which can readily be secured, being taken, will add greatly to their use.

Alloys of this character can be worked in almost every way that steel can, having for its advantages its greater combined strength and ductility and its greater power to withstand corrosion. The presence of silicon makes a harder bronze, but one of much less comparative ductility and a less malleable alloy. The presence of iron weakens and very seriously interferes with the value of the bronze. The presence of zinc in the aluminum bronze is not deleterious—in fact, it makes the best aluminum brasses.

Aluminum in bronzes lowers the melting point of the copper at least 100° or 200°. The melting point of ten per cent aluminum bronze is somewhere in the neighborhood of 1700° Fahr. Aluminum bronze is among the hardest of the bronzes and hardens upon cold working considerably. This hardness, however, can be lowered by annealing at a red heat and plunging into cold water. Aluminum bronze can readily be worked in a lathe and the chips cut smooth and long and do not clog the tool. Aluminum bronze is a remarkably rigid metal under transverse strain, being much more rigid than ordinary brass or even gun bronze; and under compression strain, although rather low in elastic limit compared with its ultimate compressive strength, it is still much stronger than any of the other bronzes, and there is a long period of gradual compression before finally giving way, making it a peculiarly safe metal under compression. Aluminum bronze has special anti-friction qualities, owing to its fine grain texture and peculiarly smooth and unctuous though hard surface, which resists abrasion remarkably.

Sound castings can be made with aluminum bronze if the precautions are taken to avoid the difficulties which are particularly imminent in melting.

1st. Care must be taken not to overheat the metal, for if the metal is heated to too high a temperature, the aluminum will oxidize, the aluminum oxide which is formed making the entire casting "dirty." The metal will also be spongy from the presence of large amounts of occluded gases.

2d. The scum which floats on top of the melted bronze in the crucible must be prevented from going into the body of the casting. This is accomplished by providing the casting with suitable skim gates.

3d. The greatest trouble in making bronze castings, however, arises from the shrinkage of the metal, which is very excessive; but the difficulty can be overcome if the casting is given a large sinking head and "risers." It is necessary to make the sinking-head fully as large as the casting in many cases.—Aluminum World.

Concentrates.

THE Zeila and Argonaut companies of Jackson, Cal., paid out $20,000 for labor and supplies in October.

OVER 2,000,000 shares stock were sold in the Colorado Springs mining exchange on the 12th inst.

QUICKSILVER from the Savona mines has been placed on the market, says the Kamloops, B. C., *Sentinel*.

NEARLY $50,000,000 gold has been produced from the Cariboo, B. C., district since its first discovery in '59.

NEW YORK MEN are reported buying seats in the Colorado Springs Mining Exchange, paying $1000 therefor.

BEN WILSON is reported to have sold his placer ground in Boise basin, Idaho, to a London company for $300,000.

THE Homestake Mining Co. will pay its monthly dividend of 25 cents per share, amounting to $31,250, on the 25th.

AT Keswick, Shasta Co., the Iron Mountain people are reported contracting to work custom ore from that vicinity.

SUPT. MORCUM proposes to put in a complete electric light plant at the Grande Ronde placer mines, La Grande, Or.

THE Merrimac mine, between Grass Valley and Nevada City, is reported sold to Colonel Stone of this city for $20,000.

CAPT. DE LAMAR has bought the Mercur, Utah, property on a $1,500,000 basis, and will take possession January 1st, '96.

AT Bodie in October 271 miners were employed. The *Miner* says $4000 assessment work is to be done on claims in that vicinity.

COLORADO AND UTAH smelters will advance charges from $1 to $3 per ton on January 1st, '96. The advance will affect only silicious ores.

THE Gold Note mine at Kennedy, Nev., is now reported paying well. The ore is sent to the Selby smelting works, and averages $150 a ton.

VAGUELY the New York *Tribune* says: "The golden age of the Sierras has not yet passed away." No, it has not; in fact, it is just beginning.

PUEBLO, COLORADO, announces that it will no longer play second fiddle to Denver or Colorado Springs, but will have a mining exchange of its own.

THE annual report of the Con. Cal. & Va. Mining Co., published on page 342, shows that the Comstock is by no means extinct as a producer of silver bullion.

THE Edna mine, near San Andreas, Cal., is reported sold to Mackay & Flood. The shaft is to be sunk to a depth of 1500 feet, crosscutting to begin at the 800-foot level.

"TO DECIDE A BET," this column is asked to state whether South Africa or California "was ahead in the gold yield in '94." South Africa produced the larger number of ounces of gold in '94. This country's gold yield for '94 exceeded in value that of South Africa. The question is not precise, but these facts may aid in determining the wager.

A RUSH is reported to locate mining claims in a newly discovered section on Mt. Bill Williams, near Williams, Arizona. Old local prospectors are not among the rushers.

SOME scary stories were afloat in the early part of the week regarding the burning of the flume of the Utica mine by prevalent forest fires. According to latest advices, the fire is under control.

THE Holcomb Valley Mine and Mill Co., in San Bernardino county, has suspended operations. The company recently failed to secure a patent on their land, which was awarded to the Southern Pacific Co.

THE mill at the English Mountain mine, Graniteville, Nevada Co., will be shut down December 15th. Supt. Howard has gone to New York; he will return in the spring, when operations will be resumed.

THE Petticoat mine, Railroad Flat, Calaveras Co., is reported sold to E. C. Loftus of Sonora, who recently purchased the Keystone mine at the same place and erected a hoist and mill of three 3-stamp batteries.

FOREST FIRES last Thursday destroyed the hoisting works of the Tin Cup mine, three miles east of Placerville, El Dorado Co. The shaft also was destroyed. It was the property of W. H. Martin of the Rawhide mine.

IF England insists on the permanent establishment of the Alaskan boundary line as mapped out by the Canadian civil engineers, the city of Juneau and Douglas island, where some of the richest gold mines are located, will become British territory.

A NOT UNUSUAL FEATURE in the recent rich find in the Gray Eagle drift mine, Placer Co., is that the drift extends beyond the line of the mine into lands recently taken up by a man named Clark as agricultural and then bonded to the mining company at $60 an acre.

A JOHANNESBURG CORRESPONDENT says there is a splendid opportunity for some one to start a good American hotel there; that big money could be made catering to a class of well-paid mining men, who would be willing to pay well for superior accommodations.

COLORADO figures that in '93 there were employed in mines, mills and smelters in that State 22,951 men, and now 26,379, a gain of nearly 15 per cent. The big increase is, of course, in Cripple Creek and other gold districts; the decrease in the Aspen and other silver districts.

STOCKHOLDERS of the Owens Consolidated Mining Co. want to change the principal place of business from San Diego to Oakland. W. B. King of Oakland represents 89,970 shares. The mine is near Julian, San Diego county, has produced $500,000 in gold, and operations are to be resumed.

ARCHULETA Co., southern Colorado, sends the biggest gold story of the month. A gold vein is reported "1000 feet across," averaging $8 a ton, and the man who figures so many feet each way, so many tons and so much to the ton has already illustrated the facility with which all the debts of the different nations can now be paid.

RESIDENTS at Stone Station, Montana, complain that at the time the Montana mineral land commission was making the classification large tracts of mineral land had been selected as agricultural; that the thing had been carried so far as to include placer ground that had been worked for a decade, and was actually being operated upon when the commission was at work.

A. D. WHITTIER, agent and manager for the Cariboo Gold Fields Company, says that next season a standard gauge railway will be begun, running from Kamloops on the Canadian Pacific to Bakerville, in the heart of the Cariboo gold district, 350 miles farther north. The road is estimated to cost about $22,000 a mile, or $7,700,000, and eventually is expected to reach the gold fields of Alaska.

A PHŒNIX, Arizona, paper says entire districts thereabouts are literally tied up by a few men who own all the way from 20 to 100 claims each which they cannot or will not work and will not allow any one else to. For miles and miles, no matter which way the prospector turns, he finds the ground located. Such a course is financially suicidal, not only for the individual who adopts it, but for the entire country.

THE Venturina Mining and Milling Company has incorporated at San Diego, Cal., to transact a general business in mining for precious metals and for oil or gas, deal in water, water rights, electric plants, smelters; capital stock, $100,000; amount subscribed, $51,100, by the following five directors: J. G. Witherby, $17,000; N. R. Titus, $17,000; J. W. Brenning, $17,000; J. A. Flint and O. C. Smith, $50 each.

IN Cripple Creek district, Colorado, it is estimated there are 4300 men employed in the mines, which means a pay roll of over $200,000 a month. Before the panic in 1893 there were only 525 men employed in the camp. The Portland is working the greatest number, the pay roll showing about 200; the Victor has 130 men employed, Isabella 70, Strong 68, Independence 50, Elkton and Moose 70 each, Union 65, Last Dollar 75, Anaconda 60, Anchoria-Deland 50, C. O. D. 45, and the Doctor 30.

IN Montana the penalty for attempting burglary at night is seven years in the penitentiary, while an attempt to commit the same offense during the day is only a year in the county jail. According to law, also, the day is between sunrise and sunset. A man was tried recently in Butte for attempted burglary in the night, but his attorney established the fact that the crime was committed at 5:10 in the morning of August 5. The almanac showed that the sun rose at 4:56 A. M. on that day, and this enabled the accused to get off with nine months in jail.

SOUTH AFRICA takes precedence in the magnitude of its mining fights as well as in other things. A dispatch from Johannesburg, dated the 8th, says a serious tribal fight had taken place in the Rand between employes of the Jumpers mine and those of the Geldenhuis and Treasury mines. Fully 2500 Zulus and Shangans took part in it, pickaxes, rock drills, stones and other weapons being used. After a furious hand-to-hand encounter, in which at least four natives were killed, the Jumpers were driven back into their compound, which the victorious Geldenhuis looted. A large number were wounded. Time was when in Pioche, Nev., a battle between half a dozen rival workers in the Raymond & Ely and Hermes would be considered worthy of extended newspaper notice. "Fully 2500 Zulus and Shangans" are capable of making a very lively scrimmage.

IT is conservatively estimated there are now about 600 men employed in the mines at Wardner, Idaho, at $2.50 and $3 a day, making a monthly payroll of between $55,000 and $60,000. The Bunker Hill and Sullivan employs over 400, the Last Chance, of which Charles Sweeney is superintendent, between 90 and 100, the Stemwinder and the Sierra Nevada each has a small force, the two latter properties being under lease, while other leased properties are also working a few men. The Last Chance concentrator is working steadily. It is reported that the force on the Last Chance is to be increased to 200 men.

AMONG Colorado dividend-paying mining stocks Argentum Juniata has paid in all $156,000; the last dividend paid was on October 15th, three cents. Bangkok-Cora Bell last dividend, one-half cent, October 5th; amount paid to that date $98,000. Elkton has paid out nine 1-cent dividends, a total of $45,000; the last one was December 15, '94. To date the Mollie Gibson has paid out in dividends $4,080,000; last dividend five cents, January 25, '95. Portland has paid $442,500; last dividend paid October 15th, two cents. Union has paid $37,000, the last one being one cent per share on May 25, '95. Pharmacist has paid out $80,000, the last dividend being paid January 15, '93. Moose has paid about $132,000; a one-cent dividend is paid every month. Union Leasing has paid $320,000 of four cents per share; last dividend July 20, '95. Victor has paid out $415,000 in dividends and a $20,000 premium is now distributed every month.

THE Carson mint disclosures, which have furnished entertainment to Nevadans for '95, still have front place. One Heney is now on trial for alleged theft of bullion. This week Thos. Price of this city, an expert witness, testified that in working gold by the chlorination process it would, if imperfectly worked, be held in solution and run off in the mint sewer. Several witnesses who had taken samples of mud from the mint sewer, which had been assayed, gave testimony. The samples ran from 25 cents to $52 a ton. The sewer had its outlet in a potato field. About forty samples of the earth therefrom were placed in evidence, with their assays, showing an average of $11 to the ton. The value of the muck in the sewer was estimated at $2000. The defense showed that a stretch of ground reaching from that potato field to the State prison, nearly two miles distant, had been turned into fine-paying placer diggings by the gold and silver which floated out from the sewer of the mint.

LAST January R. Cain was arrested at Redding, charged with the theft of two bars of gold bullion from the Gladstone Mining Co. He was tried and acquitted. At his trial he claimed that he had received the bars from G. V. Gray, superintendent of the mine, in payment for money loaned. Before the trial Gray had sailed for Mazatlan, Mexico, on the Colima. Neither side had subpœnaed him as a witness at the trial, and it was said he had fled the State. He recently returned from Rosario, Sinaloa, Mexico, where he is superintendent of the Estrella and Sierra Leon mines, 110 miles from Mazatlan. Hearing of the charges made against him by Cain, he voluntarily went to Redding at his own expense, and gave his deposition before a notary in an action of the Gladstone Mining Co. to recover the gold bar found on Cain, and is stated by C. W. Taylor, the company's attorney, to have completely refuted and contradicted every assertion of Cain's which charged him with any wrong doing.

THE case of Simpkins vs. Savage, lately decided by the circuit court for Josephine county, Or., determines an important local question, viz., rights to mine the beds and bars of Rogue river and its tributaries, the Applegate and Illinois. It is well known that these streams are rich in gold, and when the sandbars therein are exposed by low water it becomes very profitable to work them. The decision of the circuit court determines the title to these sandbars. The court held that in such streams as Rogue river the riparian owner takes to the thread of the river, subject to an easement in the public to use the stream for navigation. Meander lines described in the surveyor's notes or in the patent do not necessarily determine the boundary of the tract. They are run for the purpose of defining the sinuosities of the banks of the stream. The water is the real boundary. A grant from the Government, without reservation, of lands on the banks of a navigable stream passes title to the unsurveyed islands lying between the mainland and the center of the stream.

DR. GAZE of New Zealand has a patent there for the use of chloride of bromine as a solvent for gold, the use of caustic soda to recover the chlorine and bromine for use, and the recovery of the gold from the solution by electrolysis instead of by chemical precipitants. The most important part of his claim is the method adopted for making the solvent used in gold extracting. He proposes using a containing vessel of about three feet in diameter and two feet deep. A number of porous cells filled with plain water are placed in this vessel, each porous cell having a number of carbon rods placed in it. The containing vessel itself is filled with a strong solution of chloride and bromine of sodium, and more carbon rods are immersed in the solution. The whole is fitted with a lid, one set of carbons being connected with one pole of a powerful dynamo machine, and the other set with the other pole. On passing a strong current of electricity through the electrodes the salts are separated, the chlorine and bromine uniting, and the chloride of bromine thus formed is forced into a vessel overhead.

AT last Mouday's meeting of the U. S. Debris Commission permits were given to the following hydraulic mines: Bobbie Burns mine, near Placerville, El Dorado county; Tiedeman mine, near Georgetown, El Dorado county; Blacklock mine, near Placerville, El Dorado county; Good Hope Mining Co., in the Richmond Hill mine, near La Porte, Plumas county; King Sayre mine, near Port Wine, Sierra county; Canada mine, near Port Wine, Sierra county; Pacific mine, near St. Louis, Sierra county; Ferrel mine, owned by the Eureka Lake and Yuba Canal Co., near Columbia Hill, Nevada county; Fred Lewis mine, near Spanish Ranch, Plumas county; Dutch mine, near La Porte, Sierra county; Sailor Creek mine, near Garden Valley, El Dorado county. Permits to construct impounding dams were granted for the following mines: Martin mine, near Placerville, El Dorado county; Plumas Blue Gravel mine, near Nelson Point, Plumas county; Chaparral Hill mine, near Onion Valley, Plumas county; Arctic mine, near Butte Valley, Plumas county; Michigan Hill mine, near Quincy, Plumas county; Jackson Creek mine, near Cromberg, Plumas county; Miocene mine, near Crescent Mills, Plumas county.

Scientific Progress.

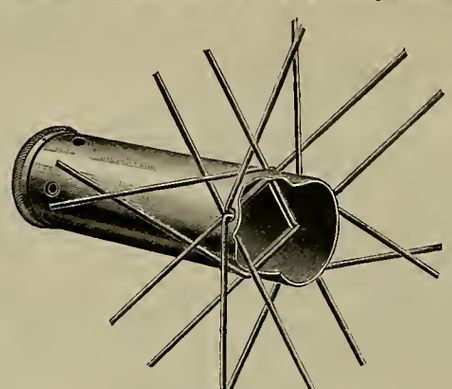
A Cure for Burns.

A discovery of the greatest use to miners, ironworkers and enginemen has been made by Dr. Thierry of the Hospice de la Charite, Paris, who found, quite accidentally, that superficial burns may be cured almost instantaneously by a solution of picric acid. When a medical student, chiefly engaged in surgical operations, he used picric acid as an antiseptic, and consequently had his hands constantly impregnated with this solution. One day in lighting a cigarette he allowed some ignited phosphorus to fall on his hand, and felt no pain as might have been expected; and on another occasion, while sealing a letter, the melted wax fell on his hand, leaving a slight trace of burning but causing no pain. During the last two years, at several hospitals in Paris, he had treated burns with a saturated solution of picric acid and obtained convincing results, all pain being suppressed instantly after bathing the injury in a solution of this acid, which is perfectly harmless. No wounds were formed, not even blisters, and a complete cure was obtained in four or five days. Dr. Thierry advocates the practical application of this discovery in mines and works where burns are so frequent; and as picric acid is efficacious in proportion to the speed with which it is applied after the accident, he counsels the having ready a supply of solution. He observes that the fifty of this acid composition, the facility with which it is preserved in saturated solutions for which there is no occasion for any weighing, and the cheapness of the product, permit of keeping ready in a small volume a sufficient quantity to make gallons of solution. "If, for instance," he adds, "a firedamp explosion should cover the miner with burns—as happens too frequently—and he be plunged into a barrel of picric acid solution, he will be saved from great suffering, often followed by death.

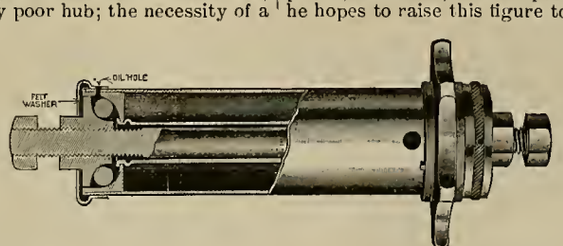
Measuring Starlight.

An English astronomer named Minchin has invented an instrument which accurately measures the quantity of light given out by a star. Stars are designated as being of the first down to the twentieth magnitude, according to the intensity of the light given out. The magnitude of a star has hitherto been judged by the eye, and anything like exactitude could not be obtained. By the new invention the rough designation of magnitude is represented by numbers which give the exact ratio of one star to another in the light-giving powers. The star Arcturus, for example, is estimated by the new process to give seventy-five and three-quarter times the light of Regulus.

This instrument will he of great use not only in astronomy but in meteorology also. The amount of light which reaches the earth from the stars varies according to the state of the atmosphere, and the inventor claims that forecasts of weather can be obtained in this way which will be far more accurate than those obtained at present.



According to *Industries and Iron*, the Mills' steel process consists of preparing pure metallic iron in a state of atomic division, mixing with this iron whatever proportion of carbon may he desired, and then fusing the mixture in a crucible. The steel so prepared is represented to be entirely free from occluded oxides of carbon, whilst the castings are remarkably sound. The process depends upon the fact that if ferric oxide or ferrosoferric oxide is heated with finely divided iron out of contact with air and cooled uuder similar conditions, ferrous oxide is produced. The operation takes place at a visible red heat, about 450 C.; but ferrous oxide is reduced to metallic iron at ahout 350 C. The hest reducing agent is carhonic oxide. This may be prepared in any of the water gas machines, using carbonic acid instead of steam. Carbonic acid is produced by the action of carbonic oxide on ferrous oxide; reduction of this oxide is effected in a slowly revolving iron cylinder. At many gas works an oxide is produced which is singularly well adapted to the process; the oxide obtainable at the Sheffield Gas Works yields, on an average, 60 per cent of pure iron, the residue consisting almost entirely of alumina. Such an oxide, after reduction to metal, is more cheaply and efficiently purified by magnetic separation than by the method usually employed. Gold and silver in remunerative quantities are almost iuvariably present in the dust rejected by the separator.



The Keely motor appears to have taken auother start. It is now stated that John Jacob Astor will invest largely in "the new force," and an electrician is quoted as saying that there is no use in devoting any more time to the development of electricity. The *American Manufacturer* is told that a box 8x18 inches in dimensions, placed on the end of a street car, will, without gearing or wire connection with the wheels, generate sufficient energy to run the car. The public, according to the latest statement, is to he given full particulars by the close of the year.

Mechanical Progress.

A New Tubular Hub.

Heretofore the weakest part of a bicycle's anatomy has been the construction of the huh. the imperfections of which have been an endless annoyance to both rider and manufacturer. A few of the complaints that have made their lives miserahle are: Breaking and chipping off the heads of spokes, indirect, and consequently imperfect oiling; accumulation of dust in the bearings; the necessity for at least thirty perforations, corresponding to the number of spokes in the hub, each perforation weakening the comparatively small huh or flange, thereby making of this important part an excellent collender, hut a very poor hub; the necessity of a

double thread for fastening the rear sprocket, and consequent possibility of loosening on the road. The new Bolte tuhular hub, manufactured hy the Bolte Cycle Mfg. Co., Milwaukee, Wis., does away with many of these objections. The 32-spoke Bolte wheel is constructed by passing four double spokes through each of the four holes at either end of the tubular huh. The accompanying cuts will show that in avoiding hooked spokes bent at sharp angles, the old trouble of tearing the holes hy high tension, as well as the danger of total displacements by a sudden jar, would be entirely avoided. This unique hub makes the rear sprocket absolutely secure. No more rear sprockets to look after; they take care of themselves.

Maxim's Flying Machine.

The machine is purposely designed of extreme size with the intention of thoroughly testing and elaboratiug the details of mechanism and of measuring the lifting power within immediate reach of a workshop and skilled mechanics, more than of actually taking to the air. This will probably be first attempted with a smaller machine, capable of lifting one man, of jockey-like proportion and mounted on a boat on a lake, so that short flights, like those of a flying fish, can be attempted for initial practice.

The lifting force of the machine is measured automatically as it runs along a railway track about one-half mile in length, and the machine is prevented from taking to flight by wheels running underneath outer wooden rails. Much yet remains to be done in the way of practice in vertical steering before taking leave of the earth, the chief difficulties of the aviator beginning when he wishes to desceud and alight on the ground again.

The machine, complete, with water, uaphtha fuel and crew of three men on board, weighs 8000 pounds. With a pressure of 275 pounds of steam per square inch, the engines develop 360 H. P. The thrust of the screws is 12,000 pounds and the lifting effect of the aeroplanes and wings (4000 square feet area) is 10,000 pounds. A thrust of 2000 pounds at 45 miles an hour gives 240-thrust horse power, or, with a speed of advance of the screw of 60 miles an hour, 230 indicated horse power.

The total projected disk area of the screws is 500 square feet, each screw being nearly eighteen feet in diameter, with a pitch of sixteen feet, thus requiring 330 revolutions a minute to give a speed of advance of 60 miles an hour.

Mr. Maxim calculates that, after making all allowances, he can at present lift twenty-eight pounds per horse power, but that, with improvements, he hopes to raise this figure to fifty or sixty pounds and then a machine could take a flight of 500 or 600 miles.

When the machine is perfected, Mr. Maxim claims that the railway may bc dispensed with and that a short run over a moderately level field will enable it to attaiu velocity necessary to rise. As far as landing is concerned, he says that the aerial navigator will touch the ground while moving forward, and the machine will he brought to rest by sliding on the grouud for a short distance. In this manner very little shock should result, whereas if the machine is stopped in the air and allowed to fall directly to the earth without advancing, the shock, though not strong enough to be dangerous (?) to life or limb, might be sufficient to disarrange or injure the machinery.

Of course this implies a tract of land of sufficient size and having surface of a proper character to permit a safe landing. If the machine be employed for regular traffic, as river steamboats are, such landings could be provided. But it has generally been supposed that Mr. Maxim's aim was to produce a machine applicable to military service, and landings of the kind considered are not portable. From a military point of view, the lives of the crew might uot be important after enough skilled navigators of flying machines have been trained to the art; but the crippling of the machine might be attended with serious derangement of plans and other bad consequences, not to mention the item of cost, which would not be trifling. The problem of artificial flight cannot be considered as fully solved till machines are constructed that can come down easily and safely upon any handy bit of level ground, as pigeons alight upon wheat fields.

The aeroplanes and wings are mounted on a slope of ahout one in eight. These surfaces are formed of canvas, stretched on a skeleton framework of hollow steel rods for the struts and thin steel for the ties. The large central aeroplane is composed of two parallel canvas surfaces, with a space between, and in this way the shape is preserved better, and the general set of the wings, smooth, like cardboard, should excite the envy and stimulate the imitation of our sail-makers for yacht racing. The front aud rear wings are pivoted ahout a horizontal axis so as to act as rudders in a vertical plane.

The machine is started from a position in which it has been retained by beiug tied to an indicator post; the propellers are then set in motion and soon drive gales of wind in their wake. When the pull of the rope has reached a definite amount—say 2000 pounds—a hook is released, and the machine starts on its voyage along the track.—Nature.

Commercial Aluminum.

Aluminum is very ductile, and has frequently been subjected to the most severe tests with most satisfactory results, and is equal in all respects to the metal manufactured hy the sodium process. It can be rolled into sheets of .0007 inch thickness, and from this beaten into leaf, equal in quality to the best leaf as manufactured in Paris. It can also be drawn into tubes or wire and spun or stamped into different shapes. It is susceptihle of a high degree of finish by polishing or hurnishing.

Aluminum becomes hard by work ing and requires frequent annealing, and if required soft, as for stamping or spinning, it must be annealed as a final operation, no matter how little worked. By forging and cold rolling it can be given considerable rigidity and temper.

Aluminum is the lightest of the commercial metals, a given bulk of it heing only one-third as heavy as a corresponding hulk of iron.

The color of aluminum is almost the same as that of silver, though instead of the dead white of silver, aluminum has a delicate purple tint Attempts are now being made to change the color of aluminum. There are reasons for the belief that many varying colors can be successfully imparted to the metal without additions which will considerably vary its chemical composition or interfere with its valuable properties. This field is an opcn one that offers valuable rewards to the successful investigators.

Aluminum for re-melting is kept in stock in what are called "waffle" ingots. They are square placques, three inches on a side and of about three-quarters inch thickness and weigh ahout one-half pound each; they are connected together with thin webs, which makes them easily detachable, in ingots which are four "waffles" wide hy seven long, weighing about fourteen pounds each. — Aluminum World.

Electrical Progress.

Electric Locomotive Performance.

The 96-ton electric locomotive has now been in operation on the belt liue of the Baltimore and Obio railway siuce August 4, '95, hauling the entire north-bound freight service of that railroad. Every train has been hauled promptly, and the locomotive has been ready at any and all bours during tbe day, causing no delay to traffic.

A few weeks ago a test was made to learn its capacity for running a loaded train on an up grade. For this purpose a train consisting of two steam locomotives, not working, and twenty-seven loaded freight cars was brought to a stop while going north through the tunnel. Here the grade is forty-two feet to tbe mile, and the rails were damp and greasy. The weight of the train alone was 1125 tons, or 1221 including the electric locomotive. Every drawbar was tigbt, no slack occurring throughout the lengtb of the train. In this condition current was turned into the motors and movement was immediately communicated to the train. At the end of one minute the train was moving at a speed of ten and one-half miles an hour, and at this point the speed was increased to the usual rate. The total distance moved in forty seconds was 150 feet, and at the expiration of one minute 450 feet.

A few days ago a test was made with a dynamometer car placed between the electric locomotive and the train wbich consisted of twenty-two cars loaded with coal, one caboose and two dead locomotives. The total weight was 1068 tons. On the 10% grade in the tunnel an average drawbar pull of some 25,000 pounds was obtained from the dynamometer diagram. The speed at this point was 11½ miles per hour. Comparison with the diagrams obtained in similar service with steam locomotives showed a remarkably uniform and steady pull by the electric eugine, due to the abseuce from it of reciprocating parts, the torque being constant throughout the entire revolution of the wheel.

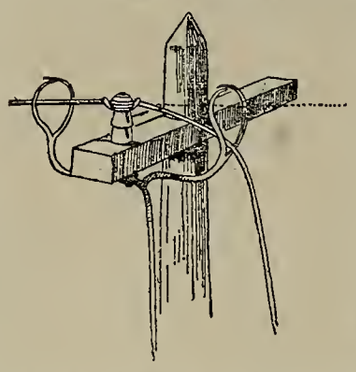
A further test was made with another train consisting of thirty-six cars, one caboose and three dead engines. This was a regular througb freight train, with a local freight attached. It was hauled with ease through the tunnel, and calculation from the previous dynamometer records and the drawbar pull per ampere showed a drawbar pull of over 45,000 pounds.

A test made on October 6th has added a new record to the list of remarkable performances of this locomotive. The character of the performance is heightened by the fact that the train whicb it moved measured over 1800 feet long and weighed about 1900 tons, and was started from rest iu the tunnel. It consisted of a north-bound freight train of twenty-eight loaded cars and two locomotives coupled to a local freight of fifteen loaded cars and one locomotive. In starting not a sputter, spark or slip of the wheel ocourred, and the train moved with the same precision as if the circumstances had been of the ordinary character. The drawbar pull of 60,000 pounds was about the record in this case. The train was quickly brougbt to a speed of twelve miles an hour and pulled through the tunnel without difficulty, with the locomotive continuously exerting a drawbar pull of 40,000 pounds.

Up to the present time no train which would hold together has been found heavy enough to cause tbe electric locomotive to slip its wheels under ordinary fair conditions. The capacity of the locomotive has been by do means reached. The tests have only shown approximately wbat the locomotive can do. A dynamometer car of sufficient capacity to test the maximum drawbar pull will shortly be secured, when definite figures can be obtained.

An extension of tbe overhead works of the electric equipment north to Waverly is being planned by the Baltimore and Ohio Railroad Company. Tbe extension would secure the service of tbe electric locomotive on the grade from North Avenue. It is also contemplated to build south to Baylies, where housing for the locomotives will be built. The one now in use is at present sidetracked in the open air when not making runs.

THE ELECTRIC LOCOMOTIVE AND FREIGHT TRAIN LEAVING THE NORTH EXIT OF THE TUNNEL.



The two additional machines ordered by the Baltimore and Ohio railroad are nearing completion at the works of the General Electric Company at Schenectady, and when finisbed the passenger service through the tunnel will be undertaken by them. The illustration shows tbe electric locomotive coupled to a north-bound freight train issuing from the tunnel.

Big Electric Scheme.

The new electric light and power company organized in Boulder, Col., will take water out of Boulder creek and from there by pipe line to Cochran's mill in Eagle Rock district, wbere a power plant will be placed to furnish power and light for tbe working of mines in that vicinity. Between the falls aud Boulder four of tbese power plants are to be established, and all of tbem are to be run by water conducted in pipes. At tbe mouth of Boulder canyon a large plant is to be established which will furnish lights for tbe city and power for manufacturing purposes. It is said that the company is backed by millionaire capitalists of New York and that the Boulder organizers are merely local representatives.

Protection from "Live" Wires.

An electric current having a voltage of 1000 is dangerous. Exposed to its

full force a man is liable to fatal injury. If a wire carrying such a current sbould be broken and tbe end fall on a person so situated as to complete the circuit to tbe earth, tbe effect would probably be fatal. This is one of the reasons why, for many years, electric light and trolley wires were never permitted to carry voltages above 500. It is now becoming common, especially on arc-light circuits, to use a voltage of several tbousand.

A great deal of study has been devoted to the invention of devices which would render such wires barmless in case of breakage. Among these appliances is oue designed by A. E. Hutchins of Detroit. At a recent public exhibition of its workings he took in his bare hand and placed in his mouth tbe end of a fallen wire wbicb, previous to its being cut for the test was carrying a current with an electromotive force of 3000 volts. He then walked barefooted into a sballow pool of water, thus establishing about as perfect a contact as was possible. Had the current still been flowing through the extreme end of the wire it would have passed tbrough him to the earth and killed him. His invention consists of provision for switching the current down to the earth by a different route. On each pole carrying the wire and on each side of the supporting insulator, he placed a Y-shaped piece of metal, connecting with a ground wire running down the pole into the earth, and there attached to a water pipe or other good conductor. The line wire is made to pass between the branches of tbis fork, but ordinarily is stretched so tigbt that it does not touch. When, however, the wire is broken it falls down so as to rest in the crotch. If there be any insulative covering on the wire this is scraped off for an inch or two when the line is being constructed, so as to leave the copper bare wbere it is liable to toucb the fork, tbus insuring a perfect contact. And to prevent the wire from getting outside of the Y, the upper ends of the latter are bent over so as to close the opening overbead. When this device comes into action, in emergencies, the current flows down the pole, and the dangling end of the line wire ceases to carry electricity. It is now no longer live, but dead and barmless.

Witb tbe increasing use of elcctricity which the future, the near future, promises in all densely populated countries, the tendency will be toward higher voltages than are now common. Unless lines carrying high potential currents are put in conduits underground, therefore, some such device as that here described will be needed. It will add a trifle to the cost of a line to use appliances of this sort; but public safety will demand and legislation will require their adoption.

Edison's recent visit to Philadelphia was rumored to have something to do with a large new local electric light company, which at one end of its system shall utilize the mountainous accumulations of culm in the coal regions, and at the seaboard end shall store the current and thus generated into batteries, whence it shall be drawn off for purposes of distribution and consumption. Tbe rumor may or may not prove to be well founded, for on the one hand the utilization of culm banks has long been a pet scheme of Edison's, but on the other he has hitherto been a determined foe of wbat he used to call "wet electricity," saying, also, that the best storage battery he knew of was a ton of coal.

A big suit came up for final hearing before the United States Court of Appeals at Chicago last week, between the Brush Electric Light Company of Cleveland and the Western Electric Manufacturing Company of Chicago, involving the double carbon lamp. Tbe Brush Company claims the patent monopoly upon the carbon arc lamp of familiar use. The patent has only one year to run, but the value placed upon it is evinced in the present suit, the evidence in which is said to have cost the Brush Company $150,000 to prepare. The latter company's claims to the exclusive manufacturing right to the lamp, it appears, have not been admitted by numerous electrical manufacturing companies, about twenty of which the Brush Company has sued for infringement. Its suit against the Western Electric was, by common consent, made the test of tbe whole question. The suit was tried in May, and

decision rendered in favor of the Western Electric. The Brush Company took an appeal. In the present case $150,000 is involved, but the payment of large amounts by other companies in accounting is dependent upon it if the judgment of the lower court is reversed. The sum total of these aggregates $2,000,000.

The Danger Line.

In reference to a case reported not long ago, in which the operator of an electric mining machine was killed, as circumstances appeared to indicate, by an electric current of a potential of 280 volts—but little more than half that which has usually been regarded as the outside danger line—Richard Lamb, in a communication to the *Electrical Engineer*, says that too much publicity cannot be given to the fact that so low a pressure as 110 volts may prove fatal, if applied to a bleeding sore and allowed to remain for a few minutes. With 280 volts applied under similar conditions the person would be killed almost instantly.

The explanation which the writer offers is that the blood is so good a conductor that the current is transmitted through the arteries to the heart.

THE Standard Telephone Co., which has made a good many promising general statements, must soon begin to put some of its projects into material shape or forfeit public confidence.

Practical Information.

No More Solid Shot.

The use of solid shot in warfare has been practically given up. The projectile of to-day is a conical shell of steel and sometimes loaded with powder so as to explode by a time fuse. It is wonderfully different from the shell of twenty-five years ago. In those days one could watch the projectile as it sailed through the air in a graceful curve, at length bursting. There was even time to get out of the way, under favorable circumstances. But the new style of shell moves at the rate of a little more than half a mile a second. In striking a metal target, its energy being transformed instantaneously into heat, it becomes redhot, and a flame is actually seen to burst forth from the point struck. Such a projectile moves, one might say, in a straight line, and its impact at a distance of a mile seems almost simultaneous with the discharge of a gun.

Such a shell, passing near a man, will tear his clothes off merely from the windage. If it comes very near, though without hitting him, it will kill him. He drops dead without the sign of a wound. Whereas an old-style shell would burst into a few pieces, the modern projectile flies into a myriad of small fragments, each of them moving with tremendous velocity. It may easily be imagined that half a dozen six-pound Hotchkiss shells finding their way into a vessel would scatter death and destruction in every direction. Protective armor, owing to its great weight, can be placed only over the ship's vitals—that is to say, along the middle part of the hull, near the water line, so as to cover the machinery. In future battles gunners will direct their fire against the unarmored ends of an opposing vessel.

"How?" and "Why?"

In his address before the British Medical Association Sir William Brodbent says: "Morphia suspends the activity of the nerve centers. But how? What chemical or molecular change take place in the tissues? How is it that the slightest change in the composition of the morphia molecule radically alters its effect? The physician cannot tell. The salts of potassium and of sodium are almost exactly similar. Yet a minute quantity of the former injected into a vein will paralyze the heart and destroy life, while the latter may be turned into the circulation wholesale with no bad result. Why is it? Why is so simple a substance as prussic acid so deadly a poison? A thousand of such questions may be asked. None of them can yet be answered. We know that these things do thus and so. How they do it we do not know; but until we do medicine will scarcely become an exact science. That we shall one day attain such knowledge is confidently to be expected. That must be the work of chemistry; and when we remember that the science of chemistry is scarcely more than a century old, and when we consider the bewildering scope and importance of its achievement in that century, it is surely not too much to hope great things from its future labors."

The Female Wage-Earner.

There was once a time when it was unusual to see a girl or woman go away from her home to earn a living, and when about the only remunerative pursuits open to her were household service of some kind, sewing, millinery work, factory work and teaching. This is no longer true. The number of women, young and middle-aged, supporting themselves, and perhaps other people also, by outside employment has increased far more rapidly than that of men in the last ten or fifteen years; and there is scarcely any trade or profession in which they may not be found. The variety of factories where they are employed is greater than formerly. In such establishments, as restaurants and dry goods stores they have to some extent displaced men and boys. And one or two entirely new fields of labor, like that of operating typewriting machines in business offices, seem to have been opened to and occupied by them almost exclusively. The failure or inability of parents, brothers, sons and husbands to provide properly devotion to helpless relatives, a worthy spirit of independence and a commendable desire to prove an equality with man may be pleaded in defence of this behavior. But a number of serious problems have been raised by the industrial revolution thus wrought, and there is room for doubt whether in all respects the world is better for the change.

In some trades the women compete directly with the men of their own families. This has had two ill effects. Wages have been reduced, at least in some cases, and the family life has been broken up. An English paper, *The Realm*, speaking of the mill-hands in Lancashire, says that there is now an alarmingly great number of deaths among infants, the men are growing weak and immoral, and it is getting to be customary for husbands to rely on their wives for support. This state of things is confined mostly to the weavers, the spinners' unions have tried to keep the women out altogether, and in consequence are said to earn nearly double the wages paid to the weavers. Just how the evils here mentioned are to be corrected it is not easy to say; but the facts show that the woman question has some puzzling phases.

Strychnia and Anti-Toxine.

In his annual report to the Secretary of the Navy Surgeon General Tryon discusses new medical treatments at length. The favorable opinion entertained of the value of strychnia in the treatment of pneumonia, he says, has been further strengthened by the experience of its use during the year. Forty-six cases of acute lobular pneumonia have been treated in the New York hospital in two years with three deaths, a mortality of 6.5 per cent.

Attention is called to the number of casualties of the naval academy resulting from the present method of playing foot-ball, and it is recommended that unless the rules be materially modified no rival games be permitted.

Anti-toxine, the new serum treatment for diphtheria, has been tried at the Waghington naval hospital in two serious cases with the most favorable results and reports to the bureau from the Health department of New York show that the mortality under this treatment is only twelve per cent.

The Polariscope and Its Uses.

The polariscope is an instrument for measuring the polarization of light, or for examining substances in polarized light. By polarized light is meant light, the rays of which have been divided into two rays of equal intensity at right angles to each other. This divison of a ray of light is obtained by passing it through a prism. A second prism is then used to depolarize the divided rays, to bring them together again. It has been found that rays of light from different objects require that the two prisms should be set at different angles in every case to produce polarization and depolarization, but that a ray from the same substance will require always the same angle. The polariscope makes use of this principle. It consists essentially of a prism, which divides the ray of light, and an analyzer, to bring the divided rays together, an eye piece and a place in which is the object to be analyzed. The Government uses the polariscope to test the value of sugar. A liquid said to contain sugar is placed between the prisms. If there is a certain amount of sugar in the liquid a certain angle must be made between the prisms, while a less or a greater amount of sugar requires other angles; and if a certain angle is needed it is a sure deduction that there is sugar present of a certain amount, and only of that amount.

World's Oldest Wooden Building.

Japan possesses what is probably the oldest wooden structure in the world. It contains the art treasures of the Mikado and is situated in Nara, which for some years was the imperial residence. The building is oblong in shape and is built of triangular logs of wood. It rests on piles. The wood used is of native growth and shows extraordinary lasting power, considering the trying climate which it had to endure for over 1,200 years. A peculiar feature about the logs of which the building is construced is that, in parts most exposed to the weather, the logs are thinner by several inches than those in a more sheltered position, the wood having gradually worn away. The treasures which the storehouse contains are of great antiquity and have been seen by Europeans during only the last three years. They consist of rare and beautiful fabrics of Persian, Indian, Chinese, and Turkish manufacture and ancient articles from all parts of the world.

To Remove Putty.

Removing putty from old sashes is not so easy a job as would at first sight appear. It is almost impossible to cut the putty out with the usual hacking knife and hammer without damaging the woodwork, says a writer in the *Engineering Magazine*. To avoid these inconveniences and the danger of accidents to clothing and hands when strong acids are used a good plan is to employ petroleum—three successive coatings of petroleum, at intervals of half an hour, generally being all that is required. It may be stated as a reason for this that petroleum penetrates into the pores of the putty and dissolves the hardened linseed oil. In a short time the putty regains its original plasticity, so that in two or three hours after the application of the first coat one can, with the point of a knife, cut out the putty with ease.

THE use of petroleum for consumption is not a new idea, as it was suggested some years ago by a French physician. Dr. Pellissier, of Roumania, was led to employ the crude oil in his practice by noting that workmen in petroleum works at Campina are never infected with pulmonary tuberculosis, and he has now reported the experience of two years. The petroleum is simply freed from earthy matter by filtering through paper and inclosed in capsules to avoid creating an aversion to it on account of its unpleasant odor. The results of the treatment are claimed to be surprising. The cough ceases, the sweats disappear, the appetite and sleep return, the lesions of the lungs recover. The breath acquires the odor of petroleum, but digestion is not disturbed. Treatment through the stomach is supplemented during the day by breathing air passed through the petroleum, a Turkish tobacco pipe being used for the purpose. Efforts to administer the remedy by injection were unsuccessful.

SOME interesting information is given in the report by the engineering society of the Michigan University relative to the rusting of iron poles and the rotting of wooden ones under different circumstances and conditions, the facts going far to show the importance of careful calculations when such effects are involved. The account states that experiments with ordinary four-inch gas pipe used as trolley poles, and set in concrete up to the surface of the ground, without other coating, developed that they would become corroded through at about 10 inches below the surface in about three years, forming a black deposit. The life of white cedar poles in the clay soil of Detroit is said to be for a period of some 13 years without protection or treatment of the butts. In the same soil Norway pine poles lasted for a space of about 30 years, but were badly rotted at the surface line. They, however, rot very soon in a sandy soil, the more pitchy ones decaying first. Winter-cut poles and those cut in the summer with the sap-wood removed are more lasting than those containing green sapwood. The *Northeastern Lumberman* says that steam piping that is covered with a non-conductor, and maintained at a temperature of from 250° to 300° F., though buried in the ground, will not corrode, while a hot water return at 212°, similarly, would corrode from the outside by rusting.

ON two lakes but a few miles from Copenhagen, says the London *Invention*, a steamer capable of running on rails will be shortly seen disporting itself. The two lakes are separated by a strip of land traversed by a railway which crosses, in its course, a road, necessitating a gradient of 1.50 on either side. The rails are carried under water on a wooden structure, and the steamer, which carries two wheels fixed on either side, so as to correspond with the rails, being guided by piles, makes for the rails at full speed, travels up the incline and down the other side, where the propeller again comes into action. The small wheels at the side of the vessel are worked by a shaft and chain. A powerful brake is used in descending the slope.

ABOUT five years ago an article appeared in one of the city papers stating that when the old city bell was taken down to be replaced by the new one chalk writing was found, plainly written thirteen years before by a young engineer. In the year 1822 the bridge over the Big Gunpowder falls, at Ridgely's iron works, about fourteen miles from Baltimore, was constructed by Robert Burr, considered at that time a famous architect and engineer of New Jersey. When the bridge was erected, several persons wrote their names thereon with chalk, and they can easily be read at this day, and the date, July 4, 1822.—Philadephia North American.

TO TRANSFER the outline and tint of a leaf, take the leaf and place over a small piece of white linen soaked in sprits of niter and insert between the leaves of a heavy book with a sheet of paper to receive the impression, lay the book away for a few days, and the leaf will then be transferred color and form to the paper.

A GOOD substitute for gutta-percha is said to be prepared as follows: Tar, one part; paraffine, ten parts, dissolve together at 120°, and then add caoutchouc, two parts. Keep at this temperature until a homogeneous mass results.—London Electrical Engineer.

Mining Summary.

CALIFORNIA.

Amador.

SUTTER CREEK DISTRICT.—*Record:* At the McIntire mine, the incline is down 220 feet. At 185 feet a station has been cut and the ore chute for loading into the hoisting tubs is nearly completed. Crosscutting has begun and drifts run both to the east and west in search of the ledge or ledges which are believed to be not far distant. The incline shaft, which stands at an angle of eighty degrees bas followed the trend of the greenstone footwall with scarcely a variance of one degree from the surface to the present depth of shaft. J. A. McIntire is manager, Jas. H. Oates foreman and timberman, J. M. Benson engineer. A steam hoisting plant is in operation capable of sinking 800 feet.

Butte.

AT FORBESTOWN.—Eight men are working on the Carlisle mine and seven on the ditch to furnish water power for the quartz mill which will be erected next spring.

At the Denver the new quartz mill will be put up this fall.

In the Goldbank tunnel the work has not been resumed. Tbe mill and mine are run continuously.

Calaveras.

GENERAL NOTES.—*Voice:* At the Gold Hill the mortar blocks are being laid for ten new stamps.

The Utica Company is laying sills and preparing ground for twelve new concentrators at the Stickle's mill.

The Tborpe mine, near Fourth Crossing, is getting good prospects. They are down about 300 feet and are getting ready to sink further.

Fifty men are at work clearing ground and grading for two new ovens which are being built for the chlorination works of the Utica Company.

A mine located about one mile beyond Rohinson's Ferry, in whicb tbe Treadwells are interested, will be opened soon. They will spend $50,000 at once getting ready to sink.

A chlorination plant, costing in the neighborhood of $10,000, is in contemplation at the Jones mine. The company is getting out about four tons of sulphurets a day, running about $60 to the ton.

The *Voice* is informed on reliable authority that tbe Calaveras Consolidated, formerly owned by English capitalists, was sold to E. K. Stevenot last Saturday. The mine is located at Robinson's Ferry.

TEMPORARILY CLOSED.—The Madison mine shut down on the 16th till the rains come, throwing forty-five men out of employment.

El Dorado.

CONSIDERABLE ACTIVITY.—*Gazette:* The Two Channel Mining Company, with H. E. Picket as manager and W. C. Green superintendent, have taken hold of the Shoofly, (better known as the Kenna mine), Wilton, Tiedeman, South Otter and Yellow Jacket, besides several new locations, and altogether have now thirty men at work. The property extends from Missouri Canyon on the north to a half mile south of the Eight Mile House adjoining the Lake Tahoe road, a distance of more than four miles.

The Shoofly gravel mine, on Mount Gregory, is the old Jonas Bitters claim, purchased of Luke and Tom Morgan, Wm. and James Kenna. A building for a ten-stamp mill is going up, and part of the machinery is on the ground. It will be completed by Dec. 10tb. D. W. C. Benjamin is the millwright and Chas. Henson of Smith's Flat foreman.

At tbe Wilton mine grading for roads and digging ditches is in progress. Several miles of grading has just been completed, connecting the mines, and shortening the distance to Georgetown by four miles.

Kern.

AMALIE MINING DISTRICT NOTES.—McKay, Stuter and Stewart have filed three new claims.

The Amalie Mining Co. have completed their drifts from shaft No. 1 to No. 3 on the 250-foot level which shows ruby silver.

Sauser, Young & Co. have located and are now working on some mines near tbe head of Harper canyon having considerable ten dollar free gold in sight.—G. E. F.

GOLER DISTRICT.—The Bakersfield *Californian* says that at Goler attention is now turning to quartz prospecting, and some good strikes have been made. A lawsuit is being tried at Bakersfield over the right to extract ore from the Rand mines at Goler.

Mariposa.

THE MERCEN G. M. CO.'S PROPERTY.—*Miner:* Much of the underground operations have been discontinued for the past two weeks to enable new and larger gallows-frames to be put up at the Melvina. The new engine and hoisting plant are in position, the cages are set: they are single deckers but will be changed to double as soon as sinking is over with. The wbole mechanism and appliances are compactly grouped in a building 130x40 feet, an iron frame affair covered with corrugated iron.

The Black Creek dam is nearly finished. The only important part not yet under way is the cement work to be done on the upper side where the timbers rest on the bedrock. The greatest number are now employed a little below the dam on the new forty-stamp mill, the contract for which has been let for some time. At the Mary Harrison mine the old incline shaft has been practically abandoned and a new perpendicular compartment one started, its location from the old one is about 500 feet northwest. The engine formerly at the incline has been moved down and the grading for the necessary buildings near the new one about completed. The boilers and pumps are left at the old workings to keep them dry. The Louisa is undergoing the same general change in the line of improvement except that sinking has not been stopped there yet. Machinists are busy as elsewhere putting the mechanism together.

Modoc.

SAID TO BE TIN.—In Modoc county, fourteen miles from the Oregon line and twelve miles from the Nevada line, is a blow-out of peculiar looking black honeycomb rock covering a space of 320 acres, with deep canyons and perpendicular cliffs. This rock contains a white metal, says the Redding *Free Press*, which seems to be tin. An intense heat burns it up; a moderate heat causes a metal to run out of the rock which appears like solder. Parties in Redding have several locations in this belt, and mining experts have examined it. An assayer, to wbom a sample was recently sent, says that tbe metal is tin of good quality. No later than Saturday some of the ore was heated by Mr. Hough, and the metal run out. If it is really tin, tben Modoc has one of the most extensive tin mines in the world. Time will prove its value or worthlessness.

Nevada.

RICH ORE.—*Herald:* The Providence company has found splendid ore in the south end of their mine, wbere they are working in virgin ground. In the 1350 level, about 1400 feet from the shaft, some beautiful specimen ore has been taken out. Besides the high-grade sulphurets it contains it is spotted with free gold.

AROUND INDIAN FLAT. — *Transcript:* The Mt. George, owned by Frederick Zeitler and John F. Kidder, gives promise of becoming a dividend-payer; at a depth of 200 feet they drifted north and south on the ledge, which is now four feet thick and improving. The walls, which are of greenstone, are clean and well defined, and the ore is easily broken down. Half a dozen miners could keep a ten-stamp mill running there, and it is the intention of the company to have one before long. H. Pengelly is foreman, and with a small force of men he is working night and day. Tbe company have about 500 tons of ore on the dump, and are hoisting quartz every day.

THE STANFORD.—Tbe Stanford mine is down over 300 feet. The ledge if coming in stronger as depth is attained; their rock will average $20. About twenty men are employed, and they keep ten stamps running.

PIPE AND POLE LINES. — The Providence Mining Company's pipe line is all graded out, trenches cut where necessary, and the pipe has been strung along over the ground, ready to be put together.

The Electric Power Company's linemen are setting up poles and "brushing out" a road for the same, and is now pretty close to town. The line running to Grass Valley can be seen running up over the hill on tbe south side of the creek, and the wires are now being stretched.

The Champion company will soon begin work on their new dam in Woods ravine.

THE PROVIDENCE.—The shaft at the Providence is now 1800 feet deep—one of the deepest gold mines in the world. At a depth of 1780 feet a drift has been run south 600 feet on the front ledge, which is six feet of sulphuretted ore. Sinking will be continued.

Placer.

A NICE LITTLE NUGGET. — *Sentinel:* Tbe Alta gold mine at Alta, of which W. A. Doolittle is foreman, produced a $72 nugget last week. It's getting to be a regular thing in the mines about here to pick up such pieces.

Plumas.

READY FOR THE WINTER SEASON.—*National-Independent:* The Quincy Mining & Water Co. bave finished at Gopher Hill the reservoirs and ditches in readiness for active work next February.

At Gopher Hill the restraining dam which did such good work last season has been raised five feet, with rock and gravel, thus increasing the storage capacity to such an extent in the impounding reservoir above the dam that the company will have no trouble next season in restraining and impounding safely all the debris from their mine.

Riverside.

GENERAL MINING NOTES. — *Record:* The English company is working zealously on a number of its claims in the Gavilan country and they are showing up in fine shape. Edgar Battye finished a contract on one, a mile north of the Santa Rosa, this week, and from all accounts it is a promising prospect. He sank a sixty foot shaft, at the botton of wbich he drifted north and south 100 feet. The drift has opened up a fine ledge over a foot in width and it assays well. The company is running tbe Santa Fe mill nigbt and day on ore from its claims, and tbe results are said to be entirely satisfactory.

Messrs. Hutchinson, Murphy and Moulton have put up a whim on the Leona, an extension of the Santa Rosa, and will begin sinking on the mine next week. J. B. Dennis has recently moved the old Santa Rosa mill to the Indian Queen mine and expects to have it in operation in a short time. The company that Mr. Dennis represents own a number of good claims in the vicinity and as soon as development justifies it they will put up adequate works.

The framework for the Santa Rosa company's additional ten-stamp mill is now up, the foundation for the mill in, and the work of putting up the machinery will begin at once. The latter is now on the grouud.

Efforts are again being made to straighten out the affairs of the Santa Fe Mining company, and if successful the mine will be started up under new auspices and will have considerable capital to back it.

The miners who have leased ground in tbe Good Hope mine are all making big money, and all regret that their leases will soon expire. A number of them are making from $7 to $10 per day. Nearly all of tbis rich ore has been taken out of the ground that was abandoned years ago and many of the drifts had filled up with debris.

San Bernardino.

ON THE DESERT.—J. Ingersoll, owner of the Gypsy mine, Virginia Dale district, near Twenty-nine Palms, left San Bernardino last week with a supply train of three wagons, with 12 horses and 16 men, in addition to machinery and camp equipage. They carried supplies for two months for the wbole force. At the Gypsy mine the ore runs from $40 to $125 per ton in free gold. The mine has already been worked to a limited extent and the owners bave had a little stamp mill run by a gasoline engine at the mine since last spring. The mill will be added to and its capacity increased during the winter.

PROSPECTS FOR THE ALTURA.—*Sun:* Tbe 10-stamp mill for the Altura mine at Holcomb valley has been put in place and will start up next Monday with 400 tons of low grade ore, that will run from $5 to $10 per ton, on the dump, and with work so arranged tbat enough more can be supplied to keep the stamps pounding away for the season. This mine is situated in a bluff, at the foot of which stands the mill, on Antelope creek, where there is plenty of water, and as the ore is obtained by tunnels into the mountain, and not by shafts, the cost of getting out the ore and milling it is so light that even on this grade of ore tbere is a good profit. The mining and milling only costs $1.50 per ton, and at that figure even the $5 ore will pay. The ore is run out from the levels, of which there are three, direct to the mill, the bluff rising 1000 or more feet above the mill at an angle of over 45 degrees. It is a gold-bearing, free-milling ore and is easily worked.

San Diego.

AT JULIAN.—Horace Crinklaw, one of the owners of the Gold King group of mines, consisting of the Gold King, Gold Queen and Cincinnati Belle, is arranging for opening all three mines.

Tbe Ready Relief Mining Company has sunk a shaft on the Redman mine to a depth of 130 feet, and commenced drifting both ways on the ledge. The east drift will be under the creek and will connect with the Ready Relief mine 150 feet below the lowest levels of the latter. A raise will then be made to make tbe connection complete.

Shasta.

THE GLADSTONE MINE.—The Gladstone mine is still closed down awaiting a settlement of arrearages.

Siskiyou.

THE SCHROEDER PROPERTY.—*Journal:* The fire at the Schroeder quartz mine will not interfere with the deal under consideration from an English syndicate in its purchase. The English syndicate has several million dollars to invest in gold mines, about a million and a half for California, the Shroeder mine heing the first bargain to receive their attention. This a very valuable mine, and will undoubtedly prove a permanent and valuable gold producer for a long period of time, comprising several ledges in close proximity to each other. Tbe syndicate agent really prefers that no buildings be put up until he can decide about purchase, as a different style of buildings and larger mill would be erected if purchased.

GOOD REPORTS FROM MINING CLAIMS.—*Journal:* Espey, Hunter & Co., at their Hawkinsville mining claim, expect to realize about $5000 for the short time the mining has been carried on.

The Steamboat mine, at McAdams creek, worked by Brokaw & Co., prospects handsomely, with gold coarser than heretofore. The new owners are so well satisfied with the returns so far realized that they feel justified in going on with the construction of the drain towards Fort Jones, in order to free the claim of water for working the bedrock to good advantage.

The quartz mine of A. G. Myers in Quartz valley is turning out very rich. The Colonel will put up a mill to work the ore.

NEVADA.

ESMERALDA COUNTY.

SAID TO BE A FIZZLE.—The long deferred payday has not reached Silver Peak. The Howthorne *Bulletin* says: Last Friday the C. & C. R. R. Co. attached a bar of bullion that was shipped by L. J. Hanchett from Silver Peak. The attachment papers were served on the Wells-Fargo agent here, and the bullion was detained at this place. It is reported that Hanchett is indebted to the railroad company for a large amount. We are informed that John Chiatovich bas attached the ore, amalgam and otber property of the company at Silver Peak for debts owed.

This is a most unfortunate condition of things, and will probably result in the closing down of the mines and mill at the Peak. Rumor bas it that the men working at the mines have not been paid for several months, and they will be obliged to pack their blankets and strike out witbout a dollar in their pockets.

Late reports from the mines are very favorable, but unless Mr. Hanchett can settle the attachments, which is doubtful, he will be obliged to suspend operations.

ON THE COMSTOCK.

CON. CAL. & VA. REPORT.—Supt. Lyman, in his annual report of the Con. Cal. & Va. M. Co., dated Oct. 1st, '95, says the entire yield of the company composing the present corporation in full to October 1st, '95, per assay value, has been: gold, $61,672,168.41; silver, $69,753,805.92, or a total of $131,425,974.33. The dividends paid by the various companies composing the present corporation are: California, $31,320,000; Consolidated Virginia, $42,930,000, Consolidated California and Virginia, $3,898,800—a total of $78,148,800.

The annual report covers twelve months preceding September 30, '95, during wbicb time there has been extracted from the 1650-foot level down to the sill floor of tbe 1750-foot level of the mine 10,255 50-2000 tons of ore, all of whicb has been milled by the Comstock Mill and Mining Company at the Morgan mill, and from this ore there has been produced bullion of the assay value of $491,807.64, which shows an average yield of $47.97 7-10 per ton. This bullion carried $250,730.33 in gold and $241,077.31 in silver. The coin value of tbis bullion amounted to $364,526.56.

STATEMENT OF RECEIPTS AND DISBURSEMENTS, FROM OCTOBER 1, 1894, TO OCTOBER 1, 1895.

WHITE PINE COUNTY.

AROUND HAMILTON.— White Pine mining district has this year shipped about 1000 tons of ore that yielded about $36,000. Tbe ores shipped have about paid food, sacks, sacking, packing, teaming, railroading and smelting.

The Horn Stake mine has yielded this year about 750 tons of silver carbonate lead ore that goes 65 to 70 per cent lead and from 14 to 20 ounces silver per ton.

OREGON.

THE HAMMERSLY MINE.—There are three engines now in operation at the Hammersly mine at the head of Jump-off-Joe. One is used for a saw mill; one for the hoisting apparatus. A three-foot vein of rich ore is now being followed at a depth of 240 feet. Five more stamps were hauled in last week, making ten in operation.

GRANT COUNTY MINES.—At Long Creek, in Greenhorn district, at the Ruby mine a ledge has been struck which runs to $400 a ton. Two men are working the Bennett claim and are taking out enough gold to pay the expenses of the claim. At Granite the steam shovel has been stopped until spring, but nevertheless, a good deal of work is being done at the Bellevue mine, but employment is given to only ten persons.

AT THE SANTIAM MINES.—The big boiler for the Santiam mines is at the summit, within eigbt miles of the mines. About sixty men are getting out ore.

The Annie mine, in the Bohemia district.

Cottage Grove, which went into Receiver F. S. Younger's hands nearly a year ago, has been sold to a Chicago syndicate. The Annie is considered to be the most extensive quartz mine in that district, and contains a large amount of free milling ore.

SPENDING CONSIDERABLE MONEY.—Apostle Heber J. Grant, of Salt Lake, is at the head of the Grant Bros.' syndicate operating mines in Baker county, Or. The money expended by the brothers in the Granite district alone last summer amounted to fully $60,000.

IN SOUTHERN OREGON.

Z. A. Moody is driving a tunnel at the Edna mine, in the Ashland district, and is in 60 feet.

Swinden & Hayes have completed a ditch at their mines on Oscar creek, Josephine county, and are ready for wet weather.

The new mills at the Steamboat and Beekman & Huffer mines will soon be crushing ore.

The Jacksonville *Times* says: "All that is needed to make southern Oregon forge to the front as a gold-producing section is a wet winter. More mining will be done than ever before in that event."

The Hicks Milling Co. at Ashland will commence crushing ore from the Tolo mine as soon as a boiler for heating purposes is put in. They will also work a large amount of second grade ore from the Ashland mine.

F. Stith, at the Free and Easy mine in Kerbyville district, will put in 1200 feet of flume to run the quartz down the mountain to the arrastra.

Grayson & McCumber are developing the Anderson-Holyoke mine in Williams creek district.

At the Black Gold Channel Tunnel Co., Foots creek, the tunnel is in 1000 feet, with a number of crosscuts. There are 30 men employed and the force will be increased to 50. Hoisting works, an electric light plant and 3000 feet of rails for the new incline will be ordered.

WASHINGTON.

CLEANED UP $9000.—William Blewett took a lease on the Blewett mines in the Peshastin district from his brother a month ago and has cleaned up in that time $9000. The free milling ore goes $17 to the ton, the concentrates from $95 to $250. The properties are well developed and equipped with a twenty-stamp mill with power for forty stamps. They are now putting in four tanks for the cyanide process. By this means they can handle twenty tons a day.

BRITISH COLUMBIA.

SHUT DOWN.—At Ainsworth the No. 1 mine has shut down, apparently for lack of funds. Supt. Dan McVicar, with his force of forty-six men was let out on the arrival of Mr. Moysher, the new superintendent from Nova Scotia.

NEW MINING COMPANIES.—Following are recent mining incorporations: Main Quesnelle Gold Dredging and Mining Co. Ltd., incorporated at Tacoma; capital stock $250,000; Robt. Thompson, Ont., president; F. B. Fox, Tacoma, secretary-treasurer; and E. J. Fader, general superintendent, Quesnelle, B. C.: object of company is to take over the Fader Mining Company's business, carried on by dredging. Virginia Gold Mining Co., capital stock $500,000; office Spokane, B. C.; office and place of operation, Rossland; James Clarke, agent. Silverine Mining Company, foreign, Spokane; capital stock $500,000; place of operation, in British Columbia, Rossland; J. B. Arthur, agent. Richmond Developing and Mining Co., Vancouver, capital stock $120,000. Dominion Development and Mining Company, Vancouver; capital stock, $500,000.

THE DEAL CLOSED.—The option offered by Mr. Barnard's English Hydraulic Power Company, on Seymour creek is reported closed. The first of the $300,000 to be spent in utilizing the water power of Seymour creek has already been disbursed and the work will be started soon, it is said, on a large scale.

BUILDING A RAILROAD.—F. A. Heinze is building a railroad from Trail Landing to Rossland. He says the government gives him a subsidy of 2000 acres to each mile of road, and a subsidy of two square miles for building the smelter, which is almost finished. The process of smelting will be a combination of matting and blast furnace. Wood will be used instead of coal, and coke be brought via the Canadian coast over the Canadian Pacific.

IDAHO.

At Buffalo Bar, eight miles from Lewiston, beach miners have uncovered an old deposit of gravel which is rich in flake gold. The pay streak is 25 feet thick and men are making as high as $8 a day with rockers.

This discovery has awakened new ideas of the possibilities of the river bars throughout the gold belt.

Thirty years ago all the gravel deposits on the short side of the short curves in the rivers afforded gold in paying quantities. All of the favored locations were run over and then abandoned. It is a well known fact that river channels within banks of sand are constantly changing. The old beds are, of course, covered deeply with surface waste from the hills and have never been prospected.

The discovery at Buffalo Bar is one of these deposits, which must have counterparts everywhere.

On the reservation, below Greer's ferry, the Chinamen took $20,000 from one bar in one year. At the mouth of Alpowa, six miles below this city, were $15 diggings 20 years ago. There have been very many such bars worked out and passed over, especially on the reservation. The Indians have protected these bars for 20 years. It is within the range of possibility that the reservation placers will attract many miners to work these old river beds.

CŒUR D'ALENE NOTES.—The water problem is a serious one in the Cœur d'Alenes at present. The mills depending upon a water supply have in many cases been compelled to close down. A number of reservoirs are being built this fall, and they will greatly augment the supply.

The lack of water is seriously interfering with the working of the Hunter mill. As a consequence fifty men were laid off last week, as the stopes and chutes were full of ore and and the mill could not keep pace with the mine.

F. R. Culbertson, manager of the Tiger and Poorman consolidated properties, is gradually putting a few more men to work on the Tiger. There are a great many improvements and changes to be made, however, before the consolidated properties will be in readiness to employ a full crew. On the Poorman side Harvey and others have leased the upper workings and will use the Poorman shaft as occasion requires. The Tiger and Poorman properties will be worked from the Tiger shaft.

The changes and improvements at the Morning, including the new engine and boiler at the concentrator, are progressing satisfactorily, says the Cœur d'Alene *Miner*. They are bricking up the boilers and preparing to put in the engine. The building has been framed and will be erected as soon as all the machinery is in place. About fifteen men find employment around the concentrator. At the mines there is, of course, nothing but development work in progress. There are about twenty-two men working on the You Like, including those employed on the tramway which is nearing completion. There are twenty-five men at work on the Morning.

The Standard mine in the Cœur d'Alenes is one of the most remarkable properties in the Northwest. It is owned by John A. Finch and others. During October it paid $95,000 over and above all expenses, and there is enough development in the property to warrant such returns every month.

FINDING THE LEDGES.—It seems that the old camp of Florence is destined to again become a great producer. All old-time miners will remember that it was the first placer camp discovered in Idaho, and that it was probably the richest ever known in the territory. The returns were marvelous, but the ground was soon worked out, the pay being found up in the hills rather than in the gulches. The origin of the gold has always been a mystery, but miners have always believed that rich ledges existed there. From reports it appears that the ledges are being discovered; they show no outcrops, the prospectors being guided by streaks that they find in the wash. Following these, they come upon seams, which uniformly widen as they are sunk upon. A custom mill has been erected there, and ore from a number of claims has recently been milled. The returns vary, but some rich rock has been treated.

THE TIGER AND POORMAN.—*Miner:* The Consolidated Tiger and Poorman mines have now 125 men on the payroll, of whom about seventy are working directly in the mine, some taking out ore and others working on development. A crosscut is being run on the 1100-foot level to connect the vein with the bottom of the Tiger shaft, which are about seventy-five feet apart on that level. This has been carried about fifteen feet so far, and it is expected that the vein will be reached about December 1. The ore is coming from the 900 and 1000-foot levels.

THE FRISCO MINE.—The Frisco mine got under full headway again on Monday last, the concentrator being started up on both shifts on that date.

There are now about 105 men on the Frisco payroll, and this includes a few who are finishing up some outside work, such as building a powder magazine, fitting pipes and so forth. In a very short time the working force at the Frisco will be reduced to 100 men or less in place of about 155 men who were on the payroll before the new machinery was added. Thus a daily saving is effected of the wages of fifty to sixty men, amounting to about $200, so that the new compressor plant will pay for itself in about six months. There is not a single drill used anywhere in the mine.

MONTANA.

THE PRIZE MINE.—Harry and William Murray have sold the Prize mine, in Deer Lodge county to New York parties, the consideration announced being $100,000. There has been paid $15,000 on the deal. The Prize mine is located at Cone Butte, Deer Lodge county, a few miles from the Jay Gould. A 10-stamp mill is on the property and has been running two years. The ore is free milling gold and the vein a strong one. The new owners expect to erect a larger mill and work the mine on a more extensive scale. Murray Bros. developed the Prize mine from a prospect. They sold the Bell Boy to an English syndicate for $40,000, and then commenced work on the Prize mine.

CLARK'S LATEST PURCHASE.—W. A. Clark of Butte has bought W. Bennett's interest in the Royal gold mine; the money has been paid. Clark gets 121,000 shares out of a total capital stock of 350,000. The price paid is not yet furnished the public. The road from Deer Lodge to the mine is to be completed and the property worked to its fullest capacity.

The Royal is at the head of Boulder creek, a small stream that puts into Flint creek, and is said to be the greatest gold mine in Montana. Nelson Bennett, Willard Bennett and Conrad Kohrs spent nearly $100,000 in its development and in the erection of a 10-stamp mill. The ore averages $32 per ton and has paid dividends since the fall of 1893 at the rate of $200,000 per year, or about $17,000 per month. It is said there is enough ore in sight to last five years.

THE INDIAN QUEEN.—*Inter-Mountain:* At Birch creek, eight miles above Apex, the Indian Queen copper claim is being operated. The ledge is said to be from 150 to 200 feet in width and the outcroppings can be traced for about two miles, running northeast by southwest. The Indian Queen was first worked by Col. P. R. Dolman of Butte, who took out a few cars of copper ore from within 60 feet of the surface. The hanging wall was in lime and the foot wall in granite. An expert from Butte was called to make an examination of the ground for one of the big copper companies of Butte, but he condemned it because of the formation. The shaft is now 200 feet in depth, but the ledge has not been crossed to the walls. At 100 feet four feet of the ledge will assay 22 per cent copper. On the 150-foot level there is a better showing, and at the 200-foot level a crosscut south shows copper glance. As yet the shaft is perfectly dry and sinking will be continued to below water level. The lessees recently refused to rebond the property for $150,000 to the same company which had been offered an option for $75,000 three months ago. W. A. Farlin and brother of Butte, the owners, and Frank Bennet & Co. hold the lease and bond for $40,000. They expect to take out enough ore in a few months to raise the bond.

OWNERSHIP OF A VEIN.—At Helena, the Supreme court has made a decision in a mining case in which Hon. W. A. Clark, chairman of the National Bimetallic committee, was the defendant. The decision of the Third Judicial District court in Butte was affirmed, which was against Clark, compelling him to pay $40,000. The decision decides the ownership of a vein which dips under an adjoining claim. The Niagara and Black Rock claims adjoined, running east and west, the former on the south. The apex of the vein in controversy passed through the west end line of the Black Rock and crossed the common side line 513 feet westerly from the east end line of the Black Rock, and continues across the Niagara, passing out of the east end line thereof. The vein dipped to the south. The Black Rock extracted ore from that vein on the dip at a point under the Apex, which is on the Niagara and south of the perpendicular plane sunk into the earth at the common side line. The lower court decided that the Niagara people were entitled to an accounting against the Black Rock for ore taken from the dip of the vein under the Apex, which was on Niagara ground and east of the point where the apex passed wholly within the Niagara premises.

UTAH.

TO SAVE MORE GOLD.—President John Beck of the Bullion-Beck mine in Eureka says that, in place of the proposed amalgamation plant, the company has constructed a large reservoir at the foot of the dump, in which all the water from the concentrator is deposited and settled, and the surface water, which carries chlorides, is again pumped up to the mill to be used the second time. By this method it is hoped to save practically all the values in the ore, as the sediment in the reservoir will carry nearly everything that escapes the vanners in the mill.

CAMP FLOYD DISTRICT.—An enterprise recently projected is that by H. M. Ryan of Chicago, who believes that an immense blanket vein, many miles in extent, underlies the entire Camp Floyd district, and that to strike pay ore anywhere it is only necessary to dig a hole deep enough. He has secured control of thirty-seven claims situated in different parts of the district and proposes to send a drill down on each of them. His theory is shared by many mining men. In his undertaking he is backed by Chicago capitalists, who have placed $125,000 at his disposal for preliminary work. Mr. Ryan is one of the incorporators of the New Bassick Mining Company, which is contending in the Denver courts for possession of the famous Bassick mine. The extent of the Camp Floyd gold belt is constantly being increased by new discoveries far beyond what was originally supposed to be the limit of the mineral bearing district. The five-mile pipe line was completed during the week and an abundance of water is now delivered to the camp. The water is pumped up to the top of a divide 1,700 feet by power furnished by the stream from which the water is taken. The Sunshine cyanide mill of 150 tons capacity, which has been completed for two months, awaiting the water supply, has been started up. This is the fourth mill for the district.

THE STERLUS AND AMANDA.—The Bingham *Bulletin* learns from O. B. Hardy that he has organized the Bingham Copper Company, which will operate the Starlus and Amanda groups. He says that 3000 feet of piping with which to pipe water to the mines for air has been ordered, and that it is quite likely that Rogers Bros.' hydraulic air-blast will be put in. A new 150-ton ore bin is now being built, and every preparation for increased and vigorous operations is being made, and it is the aim of the company to erect a concentrating mill on their ground as soon as a satisfactory mill test of the ore can be obtained. The Starlus is now in such shape that it can be made to produce from thirty to forty tons of ore per day, and the Amanda ore body is improving daily.

Regarding the electric plant to furnish lights for the canyon, power for operating mills and tramways and also an electric railroad between Bingham and Salt Lake—the enterprise in which he is individually interested and is backing—Mr. Hardy says negotiations are now going on for power to operate the plant, and that the erection of the plant at no distant time is an assured fact.

COLORADO.

NEW MILL IN THE LA PLATAS.—At Durango has been erected a mill for the treatment of gold ores by the Bromine gold extraction process. The mill was built by Messrs. Pret, Trasbier & Co. The plans and designs were made by F. Crozier and E. C. Englehardt.

The ore from the crusher goes into a revolving dryer, thence through an elevator to an automatic sampler, thence to a revolving screen. Here it is separated to a certain fineness, the fine part going to the roaster and the coarse part going to the rolls, from which it again goes to the screen and on the roaster. From the roaster it is carried to the extraction barrel, where it is kept for several hours, being in motion all the time. The solutions are allowed to settle in two settling tanks, the gold in solution is precipitated, the solution having first been conveyed to the precipitating tanks, the motion of the liquids being made by compressed air and water, or by natural fall. The gold precipitation is gathered in a filter press, and from there taken to the clean-up, containing smaller roasting, melting and refining furnaces. The ore in its travel through the mill is carried by a series of elevators. This process is somewhat similar to the chlorination process, using bromine, instead of chlorine, as solvent for the gold. Where the latter process demands from fifty to sixty pounds chemicals per ton to produce the necessary chlorine, the bromination process uses 1 to 1½ pounds per ton.

SAN JUAN COUNTY.—*Herald:* There are now over 1,300 men employed in the mines in San Juan county, at least 400 more than at any time in the history of the county. No one complains of hard times and merchants as a rule are feeling cheerful over the business they are doing. Even the little camps, which, were almost deserted two years ago, are showing signs of active life. Mines that have lain idle for years are being worked at a profit and the next twelve months will note the starting up of many which were patented and abandoned ten and fifteen years ago.

TEARING UP CLEAR CREEK.—After making preliminary preparations almost the entire year, and spending upwards of $60,000 on its plant, the Clear Creek Gold Mining and Water Power Company has started its giants at work and the bed of Clear creek is being torn up. This company owns the placer grounds all the way from Forks creek to Golden, and intends working every foot of the property. It is claimed that the proposition has already demonstrated that it is not only a profitable one, but markedly so.

The hydraulic pipe is 1100 feet long and 44 inches diameter at the opening, narrowing down to 18 inches. From the 18-inch pipe two others are taken off—one 18 inches itself and the other 12 inches. These giants have a pressure of 84 pounds at the nozzle. Boulders ten inches through are shot up an incline pipe like pebbles. The pressure is obtained by a fall of 150 feet in the 1100 feet which the hydraulic pipe travels. The sluice-boxes are 200 feet long; there are eight of them, each four feet wide. The riffle blocks are eight inches high, eight inches wide and two-thirds of an inch apart. The spaces are filled with mercury to a depth of four inches. At the end of these sluice-boxes is another 200 feet long, and in it is a grating three-fourths of an inch apart at the top, bars upright, but narrowing toward the bottom like a fan. Beyond this box is still another, where runs an undercurrent of gently flowing water with 1½-inch riffle blocks, three inches high, the top capped with flat iron straps which are slightly wider than the surface of the riffle, so that water flowing over and dropping into the riffle space churns the gold. Before the gravel is discarded, it is turned into another sluice-box, 48x24 feet wide, divided into boxes four feet wide and running the entire length, each of which is floored with carpet and fitted at the opening end with a gate. The flume to operate the plant is 10x6 feet and 2600 feet in length. The raceway is 700 feet long, making an uncovered space of 3300 feet.

THE FLORENCE CYANIDE PLANT.—President Moffat of the Metallic Reduction Co. says the cyanide plant at Florence is to be extended at once to a capacity of 400 tons per day. This is one of the reasons for the advance in Anaconda stock, as the great bulk of the ore taken from that mine is treated at Florence. Including transportation from Cripple Creek, the present cost of treatment is $8 per ton.

SOUTH DAKOTA.

THE GOLDEN REWARD DEAL.—*Times:* We have it from an excellent source of information that the deal was closed about a week ago and the price was $1,500,000, the first payment having already been made. All of the properties listed were not sold, the price for the entire property being $1,800,000. John D. Rockefeller, the multi-millionaire, is said to be the purchaser.

MICHIGAN.

A BIG DEAL.—It is reported from Iron Mountain that the Chapin Mining Company has secured control of the Ludington and Hamilton. The Ludington and Hamilton were flooded four years ago and have since been idle. When active they employ 1500 men and can send to market several hundred thousand tons of ore each year. With the Chapin mine and its other properties the company can produce half a million tons of ore annually.

NEW MEXICO.

AROUND SILVER CITY.—*Sentinel:* A 1000-ton ore bin is being built at the Copper Queen mine at Cooney. As soon as finished, grading will begin for a 15-stamp mill.

Iron mining has been started at Hanover again since the Silver City & Northern R. R. has been repaired, and four cars of iron ore are being daily loaded and shipped.

The Ivanhoe smelter is working steadily, putting through 45 tons of ore a day. The company is employing 125 men.

Development is being steadily pushed on the Maud S. mine at Mongollon. A strike of some very rich ore has been made in the bottom of the mine within the last few days. Manager, Col. E. C. Bennett; foreman, R. E. Guntber.

The Mineral Point Zinc Co. has resumed work at Hanover, and restarted shipments with a car of zinc ore yesterday. The ore goes to Mineral Point, Wisconsin, and other shipments will follow regularly. Arrangements are being made to open up and ship ore from other zinc claims in this district. Before the washouts on the Silver City & Northern road took place arrangements were being made for large and regular shipments of zinc ore from here to St. Louis, Mineral Point and several other zinc smelting works in the

United States. The washouts broke up the negotiations, but they are now being resumed and numbers of valuable idle zinc mines here are expected to be producing within the next few months.

ARIZONA.

A NEW MILL.—The *Eye* chronicles the arrival of T. D. Gray, who it says will build a 50-stamp mill "near Ehrenberg."

SHANNON'S COPPER MINE.—C. M. Shannon is working his copper mine and disposing of 200 tons a month to the Arizona Copper Company, at Tucson, Ariz.

PIMA COUNTY.

THE MAMMOTH.—Thos. L. Bailey, superintendent of the Collins group of mines, adjoining the Mammoth, on the San Pedro, tells the *Citizen* that publicity of operations at the mine draws men there in search of employment and he has none to give: that the foundation for the mill is completed and the machinery for the same nearly all on the ground. The pump at the river has been put in place on the San Pedro. It has a capacity of 100,000 gallons in twenty-four hours. The pipe line between the pump at the San Pedro and the reservoir at the mine is three miles in length and is of three-inch pipe. The reservoir is cement lined and has an elevation of 850 feet above the river level. In the mine the work of development is being pushed ahead. The main working shaft is now down 300 feet and a winze driven from the surface is nearly of the same depth. When completed crosscutting will begin and the extent of the big ore body determined.

YAVAPAI COUNTY.

PLANET-SATURN CO.—At Fool's gulch the Planet-Saturn Co. have begun work on their claims. At the bottom of their 90-foot winze they have five feet of solid quartz which is rich in sulphide ore. These sulphurets, when freed from the quartz, go as high as $2000 per ton, and the quartz just as it is taken out, without any sorting whatever, runs very high in gold. There are about 5000 gallons of water per day running into the mine at present, which gives assurance of ample supply to run the mill as greater depth is obtained.

LOWER CALIFORNIA.

NEW MANAGER.—*Lower Californian*: A new manager has been appointed for the Progresn mining company, whose extensive properties are about fifty miles north nf La Paz. The new official has power to thoroughly test the capacity of the mine, and if everything proves satisfactory will give permanent employment to 1,000 men.

MEXICO.

A LARGE REMITTANCE.—The Anglo-Mexican Company of San Jose de Gracia, State of Sinaloa, has remitted to the mint of Culiacan six bars of bullion of which the gold was worth $115,686.25 in gold and the silver $2,810.90

Commercial Paragraphs.

MARSHUTZ & CANTRELL this week shipped two steam locomotive cranes to Guatemala.

THE Pacific Lumber Co. is building the largest redwood mill in the world at Scotia, Humboldt Co.

THE Pacific Iron and Nail Company is fittiug up a nail factory in which they will install fifty cut-nail machines.

THE Fulton Engineering and Shipbuilding Works will furnish the engines for the Sutro baths at the Cliff House, at a contract price of $6000.

IT is worthy of note in these days of swifts and scorchers that the Golden State and Miners' Iron Works of this city made bicycles here thirty years ago.

FRANK L. BROWN, of the Washburn & Moen Co., sent this week a cable to Seattle, 1⅛ inches diameter, 20,000 feet long, for the Front street railroad line in that city. It weighed 69,180 pounds.

THE Pelton Water Wheel Co. has orders from Ainsworth, B. C., Sydney, N. S. W., and the City of Mexico, the latter to develop 700 H. P. under a head of 1000 feet for an electric transmission plant.

THE Justinian Caire Company has been incorporated. The directors are: Arthur J. Caire, Fred F. Caire, Delphiue A. Caire, Justinian Caire and Anglae Caire. The capital stock is $200,000, all subscribed.

THE Baldwin Locomotive Works, of Philadelphia, has a contract from the Russian government for forty locomotives. All the engines are to be Vauclain compounds, twenty heing for passenger service and the other twenty for freight service.

THE Gates Iron Works, of Chicago, has just shipped fifteen carloads of machinery to South Africa. The shipment includes three large Corliss engiues, one of which is for hoisting, nne for pumping and the third for milling purposes; also several rock and ore crushers.

THE Krogh Manufacturing Co. has a contract for a Sutter island reclamation plant which comprises a 160 H. P. triple expansion engine, boilers and pump. A pump of 600,000 gallons hourly capacity is being made for a Salinas river, Monterey Co., irrigating enterprise.

THE Fulton Engineering and Shipbuilding Works has sent to the Brunswick mine, Nevada county, the two air compressors they recently built for that mine. They are similar in general construction to those previously described which were placed in the North Star mine.

AMONG recent sales made hy the Parke & Lacy Co. are machinery for the California Furniture Company's factory, a pumping and hoisting plant for the Gold Bar Consolidated Co., Plumas Co., a pumping plant for a reclamation project at Willows, and a cableway for a Honolulu sugar plantation.

THE Dow Steam Pump Works this week shipped to the North Star Mining Co. the large sinking plant described in the issue of Aug. 24, '95. It is over twenty-one feet in length and weighs 15,000 pounds. The company has completed six pumps for Government vessels at Port Townsend, Wash.

THE four wheels for the plant of the Niagara Falls Hydraulic Power and Manufacturing Co. are being built by James Leffel & Co. of Springfield, Ohio, under general plans and specifications made by W. C. Johnson, the engineer. Three of these turhines are specified to generate each 1700-horse power under a head of 205 feet, which is the minimum head estimated as obtainable and to run at a speed of 250 revolutions per minute. As tbe ordinary head will be from 210 to 215 feet, the power of these wheels will he from 1800 to 2000-horse power each. The turhines are mounted on horizontal shafts of the double-discharge design, are fitted with runners seventy-four inches in diameter, made of bronze metal, fitted with balanced gates, and are so designed that the wheel runners are balanced, due to the equal discharge of water on each side, thus doiug away with all end-thrusts on the shafts.

Personal.

JIM WARDNER is at Angels, Cal.

W. C. RALSTON has returned from Carson Hill.

A. B. PAUL has returned from a trip to Shasta county.

C. H. LINDLEY has returned from a professional visit to Redding.

T. G. E. WOLLEB is investigating mining property in New Mexico.

GEO. BROWN is superintendent of the Copper Queen mine at Cooney, N. M.

C. D. LANE is examining Riverside county mines, with a view to purchase.

J. T. BOLLS is superintendent of the mine and mill at Riverdale, Union Co., Or.

D. A. MCDONALD has taken charge of the Pactolian mine, Hurleton, Butte county.

J. W. COOK is superintending operations at the Bohemia, Oregon, G. M. & M. Co.'s properties.

W. J. COLEMAN succeeds Mr. Rodda as superintendent of the Banner mine, Butte county.

HERBERT TYLER has assumed the management of the Falcon mill, near Murphys, Calaveras Co.

SAM GODBE, who bas been visiting his Pure Quill mine in Calaveras Co., has returned to Salt Lake.

HUGH MCDONNELL has an option nn the Potter quartz property, Pittsburg district, Shasta Co.

E. T. PERKINS, JR., of the Idaho Geological Survey, left here this week for New York, via Panama.

JNO. F. KIDDER, State Debris Commissioner, is reported seriously ill at his home in Grass Valley.

EDW. HALSE, late of Mexico, has gone tn Coolgardie, West Australia, representing James Bros. of London.

J. B. FARISH of Denver is here. He will examine the Opportunity and Snake mines at Hillsboro, New Mexico.

J. V. KEELEY, a prominent mine owner of Keystone, Nev., and delegate to the Mexican Exposition, is in the city.

JARED ROUNDY succeeds the late Dennis Sullivan in the foremanship of the Bullion-Beck mine at Eureka, Utah.

W. H. CLARKE, recently of Pittsburg, has assumed charge of the Pennsylvania Oil Company's Works at Natrona, Wyoming.

ALEX HILL, formerly of the Rio Tonto, is general manager of the Mountain Mining Company's property at Keswick, Shasta Co., Cal.

W. H. SHARP, president of the Golden Star Mining Co., Downieville, Sierra county, went to London this week to confer with the company.

N. H. FOSTER, late auditor of the motive power aud machinery department of the S. P. Co., has heen made assistant to Manager J. A. Fillmore.

R. PAINE, an English mining engineer, is visiting the Alaska mine in Sierra Co., which was recently reported sold and $10,000 of the purchase price paid.

R. S. MOORE AND JAS. SPROULE have heen appointed hy the Manufacturers' and Producers' Association as delegates to the Trans-Mississippi Congress.

H. H. MILLER, formerly connected with the Rosario mine, Honduras, returns to that country as superintendent nf the Montserratte Con. M. Co. at Yuscatan.

E. P. RIPLEY, present third vice-president of the Chicago, Milwaukee and St. Paul, will next week he elected president of the Atchison, Topeka and Santa Fe Railroad Co.

GEN. JNO. EATON, of international fame, is in Salt Lake, Utah, where he talks of founding a great college in which shall be taught mining and electrical engineering and other sciences.

W. J. WHITCOMB of Placer has heen appointed receiver of the Cherokee hydraulic mine, Butte Co. This is the latest move in the sensational and long-continued litigation in which effort is heing made to regain and retain control of one of California's famous gold producers.

J. H. MCCONNELL, superintendent of motive power of the Union Pacific, says that for the last three winters he has heen heating trains of seven or eight cars with the exhaust steam from the locomotive air pump, and that this method is used exclusively with the exception of a few days of very cold or windy weather.

Coast Industrial Notes.

—The Atlantic and Pacific R. R. Co. will shortly place an order for 2000 freight cars.

—Nearly 400 men are now reported at work on the new railroad from Portland to Astoria, Oregon.

—The Marysville Gas Co. has reincorporated as the Marysville Gas and Electric Co.; capital stock, $500,000; paid up, $100,000.

—The wool product of Oregon, Washington and Idaho is over 30,000,000 pounds this year. Free trade has helped cut the price down to 6 cents.

—The Suisun Trustees have planned to build a water-works plant to cost $40,000 by the issuance of forty-year honds, hearing six per cent interest.

—There are about 175 employes of the United States mint in this city, 42 being women and girls. The present weekly gold receipts are increasing.

—The Pacific Paving Company of San Francisco bas incorporated. Incorporators—J. H. Swift, J. Rice, I. L. Thurher, F. N. Neuval and J. T. Wilson; capital stock, $300,000, all paid up.

—At a recent auction sale of horses from the Chino ranch the prices ranged from $2 to $17.50, and some of the horses sold were ones which a few years ago would have been in demand at $100.

—After December 1st the Southern Pacific Company will refuse to handle cars that are not equipped with grab irons, according to law, and after February 15th will refuse cars on which the draw hars are not at the standard beight.

—The first petroleum refinery in the State will he built at Puerto, between Los Angeles and Pomona. Two Standard Oil representatives have been there for the last sixty days, and twelve carloads of material for the building have arrived nn the ground.

—The Sacramento Electric Power and Light Company has incorporated; capital stock, $1,500,000; $16,000 subscribed. Directors—Albert Gallatin of San Francisco and Andrew J. Ralston, Horatio P. Livermore, Charles Livermore and Joshua Barker of Oakland.

—The California Northern Land Company has been incorporated here "to do everything and every business that a natural person can do:" capital stock, $300,000: $81,000 subscribed: directors—E. Rochart, J. T. F. Schlingman, S. Wangenheim, S. Newman, J. Newman.

—The Washington Coal and Timber Company has incorporated here to buy and sell real estate, timber land, mining property, etc.; capital stock, $1,000,000; $570.000 subscribed; directors, W. E. Stevins, M. Wunch, J. Cashin, J. Kavanagh, T. Campbell, D. M. Cashin and M. Campbell.

—For the first nine months of '95 the rail shipments from Washington hy the Great Northern, Northern Pacific and Canadian Pacific roads were 65,634,000 feet of lumber and 1,668,264,000 shingles. For the same time in '94 there were shipped 49,632,000 feet of lumber and 1,443,200,000 shingles.

—The California and Nevada Meat Company has organized in Oakland; capital stock, $100,000, all subscribed hy the following directors: F. H. Brooks, $33,000; F. Hostetter, $33,300; A. C. Henry, $33,200; A. Cook, $100; W. H. Henry, $100. A. C. Henry has extensive cattle ranges in the northern part of the State of California.

—The rate war between the S. P. Co. and the O. R. & N. Co. results in a steerage rate of $2.50 from here to Portland, Or., over 600 miles by the steamship company, and a through railroad rate of $5 to tbe same point by the railroad company. The Southern Pacific has cut its rates on oat shipments in carloads from Oregon to San Francisco from $6 a ton to $3. The Navigation Company has cut the rate from $3 to $2.50 a ton.

—The Central Lumber Co. is the name of the new trust comprising nearly every lumber mill and wholesale dealer of any importance on the coast. The combine proposes to control every foot of lumber entering San Francisco by water. The concerns that don't join are to be "frozen out." E. J. Holt is president and D. H. Bibb secretary. The proposition may he temporarily successful, but is sure to go to pieces after a while.

—The attention of the railway world is at present attracted to the wonderful speed attained by transcontinental railway trains. When the rate is considered, crossing deserts and climbing three mountain ranges, it is worthy of universal note that the distance from here to Chicago, 2357 miles, can be made in tbree days, and the distance from here to New Orleans, 2489 miles, in 75 hours.

—Aggregate value of real estate in California in '95, $690,542,325; improvements, $241,994,060; personal property, $157,726,988; total value of property, $1,090,263,373; value of railroads, $43,018,640; total value of all property, $1,133,282,013. These are assessors' figures and could be multiplied by three in an estimate of true values. The original assessed value of mortgages is $195,279,838; the funded debt, $5,140,887, and the floating debt, $147,725, making the total of county indebtedness, $5,288,612.

—During '93 and '94 the Pacific Mutual Life Insurance Co. received premiums upon California business amounting to $501,800.50, and paid during the same time for taxes upon California property $39,378.75. During the same period the twenty-eight life and accident insurance companies organized elsewhere collected premiums upon California business to the amount of $8,180,208 24, and paid in California property taxes less than $6000. The California company, securing less than 7 per cent of the business, paid 87 per cent of the taxes. Since June 1, '93, besides paying claims under its policies to the amount of $793,827, it has invested upon the Pacific coast, chiefly in California, a total of $1,384,254.96.

—The Geographical Society of the Pacific held their November meeting on Wednesday evening last at Y. M. C. A. Hall, the subject heing "Drainage of the Valley of Mexico," hy E. J. Molera, C. E., with camera illustrations. Among the pictures thrown on the screen were several old Spanish maps of the valley, one coming down from the time of Cortez, showing the extent of the lake which surrounded the city, and the bridges over which the Spanish troops fought tbeir way in the desperate struggle for the capital. The lecturer gave an interesting account of the engineering work done hy the Mexican Government in drawing off the water from the lakes and marshes and tbe resulting improvement in the sanitary condition of the city. Typhoid fever was formerly widespread among natives, as well as foreigners. The disease has now greatly abated. Some beautiful landscapes in the valley were exhibited and a fine one of snow-clad Popocatepetl, "the giant mountain."

549,618.—OFFICE DIRECTORY—D. Waide, S. F.
24,898.—DESIGN WALL PAPER—A. W. Oakey, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAR FENDER.—James O'Donnell, San Francisco, Cal. No. 548,815. Dated Oct. 29, 1895. This fender consists essentially in a shield having a normal tendency to fold, whereby it is adapted to embrace the obstructing body; means for holding said shield expanded and open when not in use, and means which are best controlled by contact with the obstructing body for tripping said shield and allowing it to fold. The object of this is to provide a safety guard for cars, which will secure against accident by reason of immediately grasping and sustaining the obstructing body and preventing it from being knocked down or falling after being struck.

WATER PURIFIER AND OIL EXTRACTER FOR ICE MACHINES.—Richard F. Schroeder, Sacramento, Cal. No. 549,295. Dated Nov. 5, 1895. This invention relates to an apparatus for purifying water to be used in ice machines, and especially for extracting the oil from the water produced by the condensation of the exhaust steam from the engines so that this water can afterwards be employed in the manufacture of ice. It consists essentially of a plurality of chambers or vessels, each of which is provided with a series of overflow perforations formed in its walls just below the upper edge, a supply pipe leading to the lower portion of the initial chamber or vessel having an upwardly extending overflow pipe terminating at its upper end near the line of overflow perforations therein, a pipe from the initial chamber or vessel leading into the next chamber and terminating at its upper end contiguous to the overflow perforations therein, and a heating coil in said passage adapted to reheat the water to expel the absorbed air and assist in raising the oil to the surface, and a discharge from the second chamber or vessel for the purified water.

JOINT AND BEARING.—W. C. Rarig, San Francisco, Cal. No. 549,294. Dated Nov. 11, 1895. The object of this invention is to provide an improved means for securing the removable bushings which are employed in a joint to preserve the main parts of the joint from wear. These means for securing prevents the bushing from being loosened on the pin by the movement of the parts or by other causes. It consists of a pin projecting from a frame adapted to fit within a corresponding hole in the connecting part, a sleeve fitting the pin immovably and having its exterior surface movable within the hole in the connecting part of the joint, the inner end of the sleeve being inclined with the axis of the pin fitting against the corresponding inclined surface of the arm and a lock whereby the sleeve and pin are united together.

FISHING ROD.—Charles Kewell, San Francisco, Cal. No. 549,292. Dated Nov. 11, 1895. This invention relates to an improvement in fishing rods whereby an enlarged grip portion is provided. It consists of solid rod sections and the reel section and an intermediate enlarged grip portion made hollow and provided with slots or perforations.

NAILING MACHINE.—Samuel Wilde, Woodland, Cal., assignor of one-half to R. A. Bourne, San Francisco, Cal. No. 549,301. Dated Nov. 5, 1895. This device belongs to that class of nailing machines in which the nails are fed from a suitable source of supply through directing channels to a holder lying immediately above the work, and into which a plunger descends, whereby the nail is driven through the holder and into the work. The invention, although applicable in most of its features to the general class of nailing machines, is especially intended as a shoe nailing machine, by reason of the peculiar support for the work and the provision of independent supply hoppers for different sized nails. The part of the machine which embraces the highest novelty is the supply hopper, which is composed of an upper and lower compartment, each having inclined bottoms, the upper compartment having the slot narrower than the diameter of the nail head, and an enlargement therein through which said head can pass, and the bottom of the lower compartment having a central groove, the top of which is narrower than the diameter of the nail head and is provided with an enlargement through which said head can pass, and the end of the groove having an opening through which the nail is discharged. The hopper is shaken by suitable means, thereby causing the nails to seek and to hang in the slot and groove successively and to pass through their enlargements. Suitable channels lead the nails down to the holder and the plunger descends to drive the nail home.

COMBINED PUMP AND SADDLE-POST FOR BICYCLES.—Horace Blackman and Henry Cone of San Francisco, Cal. No. 549,308. Dated Nov. 5, 1895. This invention consists in a removable saddle-post so constructed as to serve the additional function of an air pump for inflating the pneumatic tires of a bicycle. The object of the invention is to provide a simple and serviceable pump for inflating the tires, said pump being so constructed, arranged and located as to dispense with the necessity of carrying a separate pump, as is usually done, which result is arrived at by making the saddle-post serve the double function of a saddle-post and a pump. Another object of the invention is to provide such a construction of pump as will adapt any tubular portion of or attachment to the machine for use as the cylinder of the pump, and by the extension thereof to provide a reservoir or receptacle for a repair kit.

PETROLEUM BURNER.—John J. Montgomery, Oakland, Cal. No. 549,679. Dated Nov. 12, 1895. This burner consists essentially in a chamber to which the petroleum is fed, and in which it is ignited. said chamber being closed behind the plane of the oil feed, whereby all direct draft in the line of flame exit is cut off, said chamber having one or more controllable air inlets at a point or points in advance of the plane of the oil feed, whereby flame rotations are formed and the flame retarded to effect more perfect combustion of the petroleum.

TREE PLANTER.—Ignacio Panama, Santa Ana, San Salvador. No. 549,682. Dated Nov. 12, 1895. This invention relates to the general class of machines for making holes in the ground, which, from the use that they are generally applied to, are called tree planters, though often used for digging post holes and other similar work. The invention consists in a novel connection for operating the auger or digging implement by power derived from a suitable portable engine mounted on a wheeled frame. The object of the invention is to increase the speed, power and general efficiency of the machine.

ROTARY STAMPING AND GRINDING MILL.—John J. Newsom, Oakland, Cal., assignor of three-fourths to Thomas R. Bassett and Thomas D. Newsom of same place. No. 549,812. Dated Nov. 12, 1895. This device belongs to that class of crushing mills in which a roller is rotated within a mortar. The invention consists essentially in a rotating cam roller carried by a hinged frame which supports it clear of the material in the mortar between the successive actions of its cam, thereby allowing it to acquire momentum for successive blows and grindings, said frame by its drop and rise permitting successive stamping and grinding effects of the cam and enabling said cam to pass over unyielding and obstructing material. The object of the invention is to provide a crushing mill in which the roller, by reason of its cam shape and the manner in which it is mounted, shall have both a stamping and grinding action, whereby the material is effectually crushed and pulverized.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 21, 1895.

Silver sunk during the week to 67: copper is not advancing: the other metals are quoted a shade lower all through. Returns collected hy the *Iron Age* show that the rate of production of pig iron has reached the enormous total of 217,308 tons per week on Nov. 1. The Octoher production is estimated at 915,346 tons, as contrasted with 763,335 tons in July. The American *Manufacturer* says: "The present dullness is suspicious. Consumers know what iron, hillets, hars and plates cost, and everyhody knows just ahout what decline is possihle under a dull market. But it is a fact within the knowledge of all whose husiness it is to he posted, that there are large requirements to he filled, though it is to he questioned whether a production in excess of 200,000 tons per week of pig iron is not dangerous to the hest interests of the producers of that output. There are plans laid awaiting contingencies that may or may not happen, that may ahsorh every ton of iron made at the present enormous rate."

Copper was quoted at £43 17s 6d in London on the 9th inst. One year ago the figure was 40s 15d.

Silver shipments from England to the Orient for the first ten months of '95 were as follows:

To India	£2,968,980
To China	1,580,610
To the Straits	668,753
Total	£5,218,343
In 1894	£7,856,408

Shipments of gold last week aggregated $3,267,600. It is believed that an intermittent outward movement of the precious metal will now occur. Treasury officials admit that all present indications point to a further export of gold for some weeks, hut profess to helieve that the volume will he limited to the amounts necessary to cover the deficiency in the supply of commercial hills, which at present is light. They expect that the amount of gold to go out will be comparatively light until after the Christmas holidays. What will happen afterward they do not care to discuss.

The gist of the matter is very simple. The American people owe money in Europe on account of these dehts. Our exports of merchandise are duly credited. If, however, these exports are insufficient in value to meet the requirements, gold must he sent in settlement of the halance. The Octoher statement of our foreign trade shows that while our exports increased to a small extent, our imports of merchandise were greatly swelled, the result that the halance of trade in our favor, which in Octoher, 1894, was $23,633,135 in this year $11,960,938. For the six months ending Octoher 31, 1895, the excess of imports over exports was $31,119,749, as compared with an excess of exports over imports in the corresponding period of 1894 of $96,661,369. It is therefore not surprising that gold goes out.

The aggregate money circulation of the country Nov. 1 was $1,598,859,316, against $1,672,093,422 one year and $1,585,593,509 one month hefore. The increases in Octoher were $5,297,531 in gold, $3,207,565 in standard silver dollars, $2,423,216 in suhsidiary silver, $3,021,-399 in silver certificates, $7,491,243 in Treasury notes, and $530,869 in National Bank notes. The decreases were $227,880 in gold certificates, $1,378,136 in legal tenders and $7,100,000 in currency certificates.

A coal circular says: "The recent liheral arrivals, combined with 34,100 tons of Swansea coal which arrived since Nov. 1, have overloaded the market, as the amount at hand is equal to ahout twice the amount consumed since the ahove arrived. As seven-eights of this was sold prior to arrival, the market price has not heen seriously disturhed, although any cargo coming to hand unsold will have to be disposed of at a loss, as all our large consumers and our principal wholesale dealers are pressed for storage room. As Swansea shipments are admitted free of duty they are sold at a shade helow Australian, hence are getting a very strong foothold here, where Wallsend was formerly consumed.

Mining Share Market.

SAN FRANCISCO, November 21, 1895.

The market had another setback the past week. The decline was predicted hy this paper, but prices have not yet touched the lowest figures looked for by those said to he connected with the inside. It is contended that the manipulation is all in this line so as to uncover every share on a margin, and also to freeze out hy assessments shares held by cash huyers. It seems as if there are no moneyed men disposed to promote a deal, owing, as report says, to the Hale & Norcross still heing in court, and a desire on their part to know where they stand.

The news from the Comstock mines continues of the most favorahle character, and as worked is pushed, expert mining men hecome more convinced that there are good grounds for the helief that ore development will he made within the next twelve months which will cause, even without money hacking, shares in several mines to sell for considerahly higher prices than they command at present. Of necessity, this view is hased on the theory that the mines will he worked in the interest of shareholders and not in that of mining share manipulators. From the Alta group reliable information is at hand which is of the most encouraging character. This is also indicated hy official letters.

In the Gold Hill group the work under way is of a procrastinating character; yet this same work is putting the mines into hetter condition for expeditious working and to extracting of ore when the powers that he have frozen all outsiders out of their holdings through assessments. The work made puhlic is to the west, where it has been found there is a ledge of gold hearing ore. In Overman, Seg. Belcher, Belcher, Crown Point, Kentuck, Yellow Jacket, Confidence, Challenge, Con. Imperial and Alpha, the work under way seems to he done for the purpose of developing the west lode. In ahout all of them it has heen found that enough ore has been found to justify putting them in condition for better and more expeditious working later on. In Alpha the ore is reported at around $20, but there is higher grade ore in that mine farther to the west. Con. Imperial will soon he in ore, if they are not already in it. In Gould and Curry, and also Bullion, the west drift is still heing run so as to tap the west lode. Bullion will drain it at a considerable depth helow present workings. In Best & Belcher the work is largely of a dead character, yet it lays the foundation for more important work later on. In Con. Virginia the work under way deserves close watching. It is stated that Mr. Mackay gave instructions for certain work in that mine and two or three of the others reported to he controlled hy him, which he helieves will eventuate in finding something very good. A large number of mining men have great confidence in his judgment and think that the work will develop a large hody of ore. In this mine, Ophir and Mexican work is being done on several levels. Of course this costs money, yet the end, it is said, justifies the expenditure. In Union and Sierra Nevada the work, while not attracting attention, deserves close watching, for it is in the right direction, and if not stopped or turned aside will make itself felt before the close of 1896.

Interest is beginning to center on the Brunswick lode. The work there is in an advanced state. It now admits of running crosscrifts for the lode. When they strike it parallel drifts and crosscutting will he the order. From the general nature of the work it should not cause surprise if a deal is in contemplation in the shares of the mines owning ground on that lode, but how prices will he sent it is hard to say. After the lode is struck it will take time and money to develop it.

From the Bodie district the work is unimportant. While enough ore can he and will he found through the present workings, yet it is morally certain that the management will have to go lower, several hundred feet, hefore the hest results can be secured for shareholders. Miners in that district look for a revival there the coming year.

The following illustrates the changes of the week:

A Free Milling Gold Property for Sale.

The Mammon mines, with milling records that settle the question of doubt, fully developed for a successful enterprise, with all machinery, mill, buildings new, immense water supply, maps and mining engineers' report, clear title, and fully explained why these mines are sold. The investment positively safe and the chance of a lifetime for a small capital to acquire a fortune. Correspondence solicited that means business forthwith.

CHARLES F. KUHNEN.
Casa Grande, A. T.

Assessment Notices.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1895, an assessment (No. 46) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine street, San Francisco, California.

SUPERIOR MILL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placerville, El Dorado county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the fifth day of November, 1895, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 916 Market street, Room 81, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. HOWARD BARNARD, Secretary.

Office—Room 81, 916 Market street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the second day of November, 1895, an assessment (No. 1) of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the second day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the fifth day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 Twelfth street, San Francisco, California. Office hours from 4 to 6 o'clock P. M. Bring your certificate.

THE JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the ninth day of November, 1895, an assessment (No. 7) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of December, 1895, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 6th day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 2), of three cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Rooms 37 and 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 16th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—37 and 38 Crocker Building, San Francisco, California.

IOWA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 23d day of October, 1895, an assessment (No. 21) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of November, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 16th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. THOMAS, Secretary.

Office—Room 2, 419 California street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 77) of Fifteen (15) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of December, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

WANTED.—POSITION AS ASSAYER OR Amalgamator. Capable to take charge of mine and mill. Over 25 years experience.

C. S. A., 1212 So. O Street, Tacoma, Wash.

Assessment Notices.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of November, 1895, an assessment (No. 53) of twenty-five cents (25 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the ninth (9th) day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

CONFIDENCE SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 13th day of November, 1895, an assessment (No. 26) of 50 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 414 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 8th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. S. GROTH, Secretary.

Office—No. 414 California street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on November 2, 1895, the above sale is postponed to MONDAY, the 2d day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Supel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1895. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.

By P. M. RANDALL.

This work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

TABLE OF CONTENTS.

The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels, Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, $2.00, postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

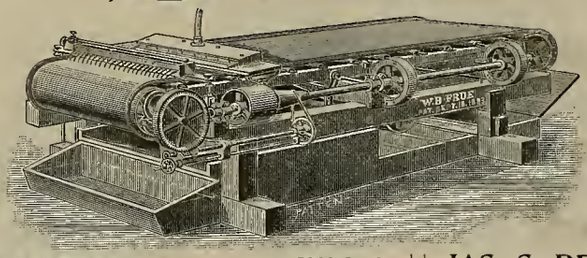
Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 196 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

By C. H. AARON.



AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Handling Refractory Placer Ground.

Before undertaking a placer proposition of any description there are two essential quantities to be taken into consideration. The first applies only to the approximate value of the ground; the second is how to handle the gravel. Herewith is presented some practical results regarding the operations of the Gold Dredging Co.'s plant at Bannack, Montana, embodying what is believed to be of general interest to many hydraulic miners. The bars on both sides of Grasshopper creek in the vicinity of Bannack have been ground-sluiced, and in some cases hydraulicked, but the actual bed of the river, the locality where the bedrock is lower and consequently holds more gold, had not, until the advent of the Gold Dredging Co., been mined at all, except in a few isolated places, where drifting was the method used. Any one who is conversant with placer mining knows that drifting is the slowest and most expensive way of handling gravel. The Gold Dredging Co. was incorporated in the fall of 1894. H. J. Reiling was elected president, F. L. Champlin vice-president, M. McDonald secretary and L. C. Bonney treasurer, all being residents of Chicago. The superintendent is Rene Curin, who was manager of the Golden Leaf, a placer mine, situated about a quarter of a mile below the Gold Dredging Co.'s ground, where drifting had been used successfully in getting out the gold.

After the first excitement had passed and the old-timers had given up hopes of ever seeing bedrock, Bannack lived on the memories of her past greatness. The numerous small claims gradually became the property of one company, but, although the owners knew they had a bonanza, they could not do anything towards reaping any benefit from their holdings. In the few spots where shafts had been sunk the water had soon stopped all further attempts to explore the pay streak.

The scheme in general consists in dredging the creek. The dirt is elevated at the same time and dumped into sluice boxes. As soon as a pit or channel has been excavated of sufficient size, viz., 500x 300 feet, the boat proceeds up stream and throws up a dam behind it. The water is then pumped out by means of hydraulic jets and the bedrock cleaned up by hand. In handling the top dirt too much attention is not paid to its richness, owing to the fact that the Grasshopper gold is coarse and lies mostly on bedrock. While the bedrock in the first pit is being cleaned the boat is digging another pit up stream.

GOLD DREDGING COMPANY'S PLANT AT BANNACK, MONTANA.

The first work that was commenced was to enlarge a ditch that tapped the creek two and one-half miles above the city. Into this the entire stream was turned, and, with a dry river to work on, it was a matter of a few days to build a dam that would raise the water to the necessary level. Then, again, when the first pit is dug the bulk of the water is turned into the ditch once more to facilitate the pumping out and cleaning up of pit No. 1. The contract for building the boat was let to H. K. McDonald, of Chicago, who had his men there by February, 1895. The boat was finished and launched on May 15th, '95.

The dredger equipment consists of two chains of buckets, viz., the main or excavating buckets, having a capacity of 220 cubic yards per hour, and the elevator buckets that raise the gravel twenty-five feet above the surface of the water, after it has passed through a rotary grizzly having five-inch openings to allow the finer dirt to fall into a hopper, where it is caught by the elevator buckets. Both chains of buckets, together with the rotary grizzly, are operated by an electric motor. The type used is the "L. W. P. 20" Ry. motor. A twelve-inch centrifugal pump is used to supply the necessary water to the sluice boxes. The capacity is six cubic feet per second, and they dig a pit twenty-five feet deep. This is run by a motor of the same type as the bucket motor. The ladder on which the main buckets travel is raised and lowered by a smaller motor, viz., a "G. E. 800" Ry. motor, and by a suitable arrangement of clutches this motor can be made to swing the boat. The anchors are in the form of spuds, made of Oregon fir 18x 18 inches by 40 feet long; they are raised or lowered by a similar motor. All the switches, levers, etc., are placed in the pilot-house, except those that are used to operate the anchors, these being placed on the machinery deck between the two anchors. There are twenty incandescent lamps and one electric searchlight on the boat, and from ten to twenty lights on the sluice boxes, consequently night does not affect the operation. The power is derived from a ditch carrying 200 miner's inches, with a head of 330 feet. In the illustration, from a photograph taken specially to accompany this article, the power-house is seen across the creek from the boat. The pipe line is shown which, although it has a fall of 330 feet, is only 750 feet long. This pipe is eighteen inches in diameter and reduces to a 2 6-10-inch nozzle, the water wheel being of the well-known Pelton type. It is twenty-six inches in diameter, and is directly connected to an Edison generator of 134-horse power capacity.

To govern the speed, which is 650 revolutions per minute, the Pelton differential governor is used. Till recently water power was regarded as a somewhat uncertain quantity in connection with

San Francisco, November 30, 1895.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gold Dredging Company's Plant at Bannack, Montana, 353. San Jose and Santa Clara Electric Railway, 360.
EDITORIAL.—Handling Refractory Placer Ground, 353. Decision by Secretary of the Interior Smith; "Manufacturers' and Producers' Monthly;" Some Ancient and Modern History Regarding the Cyanide Process; Trade Journals; "The Flood of Gold," 354.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 358-9.
SCIENTIFIC PROGRESS.—The Uses of Coal Tar; The Modern Idea of Fireproof Construction; Artificial Skin; Welding Metallic Bodies by Simple Pressure at Heats Below Their Fusing Points; Geological Specimens from the Antarctic Region; A Petroleum Tank Steamer, 360.
ELECTRICAL PROGRESS.—San Jose's Electric Railway; Electricity at Paris in 1900; Electrolysis; A Discarded Electric Motor; Long-Distance Telephones Making Giant Strides, 360.
MECHANICAL PROGRESS.—A Hydraulic Power Plant; A New Metal; Hardening Steel by Gas, 361.
PRACTICAL INFORMATION.—Splicing Belt Lacings; Eggs in Hermetically Sealed Tins; Poor Condition of the Eyes; Revolution of Transportation Methods; A New Safety Lamp, 361.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 368.
MISCELLANEOUS.—Concentrates, 355. Notes on Gold Milling in California; The Cyanide Process of Gold Extraction, 356. Mesh of Battery Screens; In California, Too; Competition; Mint Director's Annual Report; Huxley's Definition of a Liberal Education, 357. Coast Industrial Notes, 359. Personal; Notices of Recent Patents, 362.

SECRETARY OF THE INTERIOR SMITH decides that a mineral application properly filed and duly followed by notice thereof by publication and posting is *per se* a segregation of the land covered thereby, and when it is finally sought to relocate said land on the ground of abandonment the relocator should be first required to establish the fact of abandonment, which seems more equitable than some other recent decisions of his.

IN editorial mention, the Sacramento *Record-Union* cruelly says of the *Manufacturers' and Producers' Monthly*, a new publication in this city, that "it is the finest and best example that has fallen under our notice of absolute stupidity and unpardonable ignorance." The only reason for referring to the matter at all is to briefly state that the Manufacturers' and Producers' Association has officially issued a notice disclaiming any connection with any publication of any kind, an action that was certainly due to its own dignity as a commercial body since its inception.

FROM far-off Scottish dales Mr. J. C. Montgomerie writes some ancient and modern history regarding the cyanide process and present patentees. He misses the main point, viz., that the company of which he speaks makes successful claim to first public application of the principle that a weak cyanide solution would have the desired result. 'Twas known ninety years ago that cyanide would dissolve out the gold and silver, but not known outside of the laboratory till five years ago regarding the dilute solution and its applicability to separating the gold, and its selective action thereon. The letter is published in its entirety, less for any special importance attaching to it than because the demonstrated value of the process makes any and all reference to it a matter of universal interest.

WHEN a journal is established with special reference to any trade or industry it is good evidence of permanence, for few men with ability sufficient to intelligently conduct such a concern care to take hold unless it looks profitable. The motor vehicle industry is now deemed of sufficient importance to justify such an exponent, and *The Horseless Age*, a monthly publication, is received from New York. If it continues to exist it will probably change its name, which, as applied to a publication, means nothing, though it is expressive of what appears to be inevitable so far as the poorer grades of horses are concerned. An ordinary specimen of that much-neglected quadruped sold last week in San Bernardino for $1.50, the halter that the poor beast wore being the chief inducement for purchase.

"The Flood of Gold."

A recent authoritative statement that the world's gold output this year will be $200,000,000 has occasioned considerable comment. The fact is worth considering; the probability is worthy of comment.

That the aggregate gold yield of '95 should double that of '87, and that the probabilities favor an indefinite annual continuation of such extraordinary increase, is a matter of tremendous import. The topic is too important to admit of treatment from a partisan standpoint. The widest horizon is essential to a just view of the case. The diminishing output of silver and the increasing yield of gold seems to be Nature's way of restoring the disturbed equilibrium. The demonetization of silver is at last being condoned by the natural action of supply and demand, and the world-wide panic of '93 and attendant lowering of prices (the culmination of disaster resultant upon the demonetization of silver) now give way to a more prosperous order of things. Prices are on the up grade. The pendulum swings the other way. Prices have for years been steadily falling, which is only another way of saying that the purchasing power of gold has been steadily rising. That this is denied by monometallists does not disprove the facts, which are demonstrable by trite statistics. Those who even now argue that the "flood of gold" must result in a further lowering of prices appear to forget that an increase is constantly necessary in the volume of current money proportional to the steady increase in population. Our national progress and prosperity have been handicapped by contraction of the currency; if the increased output of gold results in the expansion of our national money volume, it will only be in a commensurate degree with increasing requirements. Free coinage of gold and silver for the next ten years would not give us any more than we need.

It is to be borne in mind that this whole gold and silver question is largely, almost wholly, a matter of trade balance. The gold that flows to Europe under our silly laws which make profitable the bond issues that are the shame of this country's system of financiering, does not go as money but as gold bullion, stamped and certified as to quality and value. In the broadest sense the increase in the production of gold gives no guarantee of an increase of amount in circulation, or of money at all. The mining of gold is merely the production of a commodity, just as is the mining of coal or silver or copper or iron or quicksilver. It will be prosecuted just as long as it is profitable; should profit cease, there would be a cessation as in the case of silver. Whatever the dollar, whether gold, silver or paper, it is not a standard of value; it is simply a measure of value, the same as a cental is a measure of quantity or a yardstick a measure of length. Money gets into circulation through the demands of business, and not through the production of metal. Hence it is the revival of business that will start money circulating. The mere minting of money will not create business prosperity. We see this around us in California: idle men and idle money; the banks bursting with their hundreds of millions, paying a poor 4½ per cent; foreclosure of mortgaged farms, and low prices for every product because of business stagnation. We see it also in the "Kaffir craze" across the sea, where the congestion of European money causes careless investment of a billion and a half in meretricious mining stocks. Capital withdrawn from legitimate business and enterprises cannot be forever hoarded; it seeks some form of investment and takes undue risks. What is needed is to have the hoarded money go out in such a manner as to create new business, so that merchants sell more, manufacturers make more, railroads earn more.

It is a principle of binomics that the smaller the supply of any article, with equal demand, the greater its price—whether gold or labor or potatoes; hence the contraction of the currency to a gold basis increases the value of the gold dollar, so, even without the just remonetization of silver, the working of this rule would make an increase in prices resultant upon increased gold output, this general principle being modified by the fact cited regarding trade balances. In this as in all other cases value is controlled by the law of supply and demand, but no matter how much the production of gold may increase, it can never wholly fill the place of silver to the exclusion of that metal from its rightful position in the national or international currency. The increase in the gold output will increase silver values, and, in a wider sense than local markets afford, aid the California farmer or wheat grower by lessening his present disadvantage with East Indian and Argentine competitors in London.

AS "there is nothing good or bad in this world but thinking makes it so," in like manner our views on all topics are largely influenced by environments and training. Most of the world welcomes the prospective "flood of gold" and rejoices in the increased output. There is one class that views it with alarm. It is the London bankers, whose opinion is carefully obtained by our subservient American financiers before acting. In the current number of the London *Bankers' Magazine* W. B. Lawson, an able exponent of his point of view, discourses dolorously on a "glut of gold," and says "the right of free coinage of gold may have to be suspended in England." It is amusing to read such pessimistic predictions, and it is the irony of fate that the first suggestion of gold's dethronement should come from the most devout worshippers at the shrine of monometallism. Mr. Lawson goes on to argue for restriction. He speaks of "the evil of excessive currency," and says for that evil restriction is the only remedy. From Mr. Lawson's business standpoint he is all right; from the standpoint of the world's producers he is all wrong. In his article he goes on to admit much that he heretofore denied and that bimetallists claimed, especially that the increased gold output will cause prices to advance. There is no originality in his prophesy about the demonetization of gold. Forty-five years ago eminent European financiers, alarmed at the Californian and Australian gold output, talked of the demonetization of gold to protect the holders of interest-bearing securities from loss; but in these sunset years of the nineteenth century such narrow argument has no place. Rapid transit of thought and person has changed mankind and made the world a small place. Meanwhile, in the late light from London and Mr. Lawson's solemn utterance it would be interesting to get Mr. Cleveland's or Mr. Carlisle's views on what constitutes "sound money." Should gold fail all these worthy gentlemen, the only thing consistent about them would be their inconsistency. While it is neither the province nor the purpose of the MINING AND SCIENTIFIC PRESS to discuss political questions, yet this matter of gold output and silver remonetization is so interwoven with the necessities of mankind and the business of the world that in any reference to these questions the attitude of our public men in power is of necessary note. The United States has been singularly unfortunate in its dearth of financiers, and in the ready acquiescence of so many of its public men in the views and purposes of its great commercial rival. It is high time for a new financial Declaration of Independence. The amusing part of the article referred to is the evident idea that to scare and annoy the business world is profitable to the disturbers. Hardly have the echoes died away of the cry that "we are to be ruined by the flood of silver," than comes from the same source an announcement that we are to be ruined by "a glut of gold." Treading on the heels of the successful demand for the suspension of free silver coinage comes from the same stampeders a threat of similar demand regarding free gold coinage. In financial storms such wreckers always find profit, and while they can dupe our public men they will continue the game. The most recent utterance of a United States "financier" shows how ready our public men are to even falsify history and distort known facts in an effort to keep in unison with their political masters and the transatlantic source of inspiration. On page 357 of this issue appears a synopsis of Director of the Mint Preston's report to his chief, Secretary Carlisle, who bought the right to retain his position by recanting his former truthful utterances regarding silver, in hopes of pleasing his master, the chief executive of the nation, who, in turn, takes for his guide such worthy foreign authorities as the London *Bankers' Magazine*, which, as shown above, takes so doleful a view of the increased production of gold. Mr.

Preston, in his annual report, takes occasion to refer to the demonetization of silver and says its real demonetization took place twenty years before 1873, when the weight of the subsidiary silver coins was reduced seven per cent. He says such reduction was made for the deliberate purpose of placing the country on a gold standard as to large transactions. If the director of the mint had given this part of the report any thought beyond an impulsive desire to curry favor with Messrs. Carlisle and Cleveland, he would have seen that he was saying that which was not and is not so, and that his official assertions were and are in exact opposition to the official facts. The weight of the subsidiary United States silver coins was reduced in 1853 because at that time they were worth by weight more than their face value, and to prevent their exportation, to keep them in circulation in this country, their weight was redueed. There was no talk nor thought of demonetization of silver, nor any proposed change in the then existing law regarding free coinage of silver. That Mr. Preston, as a private individual, should be ignorant of these facts is purely a matter of personal regret, but when, as a public official, holding high position in the financial affairs of the United States, he officially makes such misstatements he is deserving of censure. Official utterances usually carry such weight that it would seem as though Mr. Preston prostituted his high place in putting in his official report what is not so, and what everyone—except Mr. Preston—knows is not so.

Concentrates.

COLORADO now has nine mining-stock exchanges.

CRIPPLE CREEK, COLORADO, has now 162 shipping mines.

THE Chicago Mining Stock Exchange was incorporated this week.

GOV. HUGHES declares that Arizona will produce $10,000,000 in gold this year.

THE total mineral production of Mexico for the last fiscal year was $71,261,000.

WERE California as densely populated as Rhode Island, the State would have 55,224,000 inhabitants.

IDAHO'S Supreme Court last Saturday decided that a mining location made by an attorney in fact is valid.

A 10-STAMP mill on the Rainbow mine near Washington, Cal., is reported carried away by a landslide.

IN '94 New Mexico mines yielded a total gold value of $802,550; silver, $214,060; lead, $49,300; and copper, $13,600.

IDAHO is credited in the report of the Director of the Mint with a gold output in '94 of $2,308,775; silver, $4,879,855; lead, $2,605,450.

FROM Minas Prietas, Sonora, Mexico, it is reported that the 40-stamp mill at the Prietas will be replaced by a new 80-stamp mill.

NEW mining incorporations average about three a day in El Paso Co., Colorado. The "capital stock" is usually "one million dollars."

THE Mountain Mines Co., Shasta Co., expect to consume 150,000 pounds fresh meat per month, which is not an extravagant supply for 1000 men.

ACCORDING to the Johannesburg, South Africa, *Star*, a 404-foot shaft that it describes, sunk there, cost £20 8s 11d per foot; $102 a foot sounds high.

THE Young America quartz mine and mill at Downieville, Sierra county, with about 150,000 tons of tailings, will be sold at auction next Tuesday.

PETER TAUTPHAUS, president of the Providence Mining Co., E. F. Liebrich and F. Boeckman have taken a bond on the Sierra Buttos mine, Sierra City.

OPENING the Nez Perce, Idaho, reservation, which took place on the 18th inst., has added considerable rich territory to the mining area of the Northwest.

AT Tucson, Arizona, the government suit against the Copper Queen Co., charged with cutting timber on government land, resulted in a disagreement of the jury.

OFFICIAL STATISTICS give Arizona's gold production in '94 a value of $1,926,260; of silver, 1,539,453 ounces were mined; of copper, 31,162,400 pounds; and lead, 2,625,000 pounds.

TWO THOUSAND DOLLARS from twelve pounds of "rich ore" is the latest, this time by a miner named Dunn, at Quartzburg, Or., as reported in the Long Creek, Or., *Eagle*.

A RECENT Alaska steamer carried a shipment of T rails and fish-plates to be used in constructing a railroad in the Treadwell mine, on Douglass Island, Alaska's first railroad.

ALASKA'S gold output this year, it is estimated, will be $3,000,000, nearly $800,000 of which has been obtained from placer mining, chiefly along the Yukon river. There are about 500 stamps in operation.

THE Big Blackfoot Milling Company has a permit from the Montana Land Commissioners to cut 24,520,000 feet of timber from Montana school lands. The company is to pay $1.28½ per thousand in three years.

THE Anaconda Mining Company has filed a suit for $375,000 damages against the Butte & Boston Mining Company for ore alleged to have been extracted from the Wild Bill through the Gray Rock workings.

AT Leesburg, Idaho, the Leesburg Mining Company have expended $75,000 this season in constructing 3½ miles of ditch and 1¼ miles of flume. The company expects to be able to work its placer ground about eight months in the year. Operations are being conducted under the supervision of A. J. Bowie of this city.

THE photograph of the Gold Dredging Company's plant at Bannack, Montana, from which the illustration on the front page of this issue was engraved, was taken by John F. Schultz of Butte, Montana.

THE concern that has hold of the Dunderberg property, near Bridgeport, Mono Co., Cal., is known as the Mines Exploitation Syndicate of London. The announced capital is $312,500, of which $12,500 is working capital.

AT the Robinson (South Africa) mine, the October production of the 120 stamps, crushing 15,951 tons, was 15,192 ounces gold; from concentrates by chlorination, 983 ounces, and from tailings by the cyanide process, 1952 ounces.

ABOUT $20,000 was cleaned up last week by Portuguese miners in the Spring Valley mine at Cherokee, Butte Co., an amount taken from the bottom of the big mine, where the ground was supposed to have been all worked out.

FOR the calendar year '94, W. J. Puckett reports to the Director of the Mint that the production of the metals in Colorado was: Gold, $10,616,463; silver (at sixty-three cents per ounce), $14,961,525; lead, $3,199,175; copper, $761,575.

THE Anaconda *Standard* says that between 1500 and 2000 more men are employed in and around Butte, Montana, than ever before, even when the silver mines were running. The mines of that district pay out $540,000 per month for wages.

AT the Broken Hill Proprietary (Australia), for the week ending the 7th inst., 6163 tons of ores were treated, yielding 484 tons of lead, containing 139,180 ounces silver, also 1211 tons treated by amalgamating and leaching plants, producing 11,216 ounces silver.

IF all that Geo. Crehore claims is so, Marin county will be among the mineral producing counties of the State. He claims to know of several localities where iron and copper indications justify active development on the slopes of Mt. Tamalpais, between Mill Valley and Redwood canyon.

GRAND LARCENY was the charge on which the Madison Co., Montana, grand jury bound over Jacob Newman, who stole a stamp mill. The fact that after stealing it he sold it to a mining company, is locally considered as justifying the application of the term "grand" to the larceny.

SUPERINTENDENT ADAMS of the United States mint, Carson, Nevada, estimates the Nevada yield of gold and silver for the calendar year '94 to be: Gold, $1,220,700; silver, $997,500; the first time in the history of that State or Territory when the gold yield exceeded that of silver in any one year.

MR. E. B. BRADEN, in charge of the United States assay office at Helena, Montana, reports to the Director of the Mint that the gold output of that State for '94 was of the value of $3,868,428.87; during the year Montana mined 13,638,967.29 ounces fine silver, 186,310,472 pounds copper, and 23,566,188 pounds lead.

EVERY Comstock miner the world over will remember "the Geiger grade," and read with some interest of the death at Bishop, Cal., on the 25th inst. of D. M. Geiger, its builder. He was thrown from his horse and dragged to death. At one time his income from tolls on the famous road he built was over $5000 per month.

SIGNS in the desert, indicating the trail and giving directions to the nearest springs and wells of fresh water, have been erected by San Diego and San Bernardino counties. They are made of gas-pipe, with squares of sheet-iron at the top, painted red, as that is the color that can be seen the greatest distance in that region.

LAST FEBRUARY there was one log house on the site of the mining town of Rossland, B. C. There are now 3000 people there, the town has electric lights, a telephone system and waterworks are being put in. Rossland is in Trail Creek district, about eight miles from the boundary line. Three-fourths of the mining interests there are held by residents of Spokane.

THE $50,000 infringement of patent suit of Mrs. Carmen L. Morris, widow of Frederick Morris, against Alvinza Hayward and C. D. Lane, for using inclined canvas tables in the Utica mine to catch the gold, was decided in favor of the defendants in the United States Circuit Court, last week, the court declaring that the tables were not an infringement of Morris' concentrator.

MR. CHARLES G. YALE, statistician of the San Francisco United States mint, in an article on Alaska, in the work published by the Government under the auspices of Director Preston, entitled "Production of Gold and Silver in the United States in 1894," places the product of gold in Alaska in '94 at $1,282,623.13, and silver, $5,716.55. The figures for the preceding year were $1,038,824 and $10,983.92 respectively.

TWENTY contested land cases were decided by the register and receiver of the Sacramento Land Office last week, thirteen in Nevada county and seven in El Dorado county. In all the cases the question at issue was between claimants who held that the land in controversy was mineral and the railroad company which held that it was agricultural. Five cases were decided against the railroad company and fifteen in its favor.

A BRITISH COLUMBIA CAPITALIST has conceived the idea of putting traction engines on the Cariboo road from Ashcroft to the Cariboo mining country, to haul in supplies and take out the product of the mines. He says the plan is feasible, as the engines could haul several cars and make the grades with ease, and maintain a speed of four miles an hour over the government road. The plan is being opposed by the teamsters who have heretofore hauled supplies.

REGARDING Oregon's gold yield for 1894 the most reliable procurable data give the following figures by counties: Baker $447,995.72, Benton $2,045, Coos $109,353.77, Crook $1,050, Curry $8,800, Douglas $70,879.38, Grant $129,853.06, Hornly $1,500, Jackson $107,647, Josephine $123,676.61, Lane $32,500, Linn $5,000, Malheier $13,500, Marion $985.88, Union $1,059,070; total, $2,113,356.42. For the current year it is believed the gold yield of the State will aggregate over $3,000,000.

TO AID the unemployed in gaining a livelihood, the authorities in New South Wales give to each suitable applicant a railway pass to the gold fields, a miner's right for which he must ultimately pay, and instructions how to hunt for the precious metal. Out there they call such prospecting "fossicking," and two "fossickers" who were thus aided by the Government have been so successful that they are claiming a reward offered for the best strike in a certain territory.

TO DATE the gold coinage at the United States mint runs over $21,500,000 for '95. During the first three months of the year there were coined in gold $6,002,500; for the second quarter, $5,017,500; for the third quarter, $6,402,500; during October and November, about $4,000,000. The silver coinage at the local mint aggregates $1,500,000 for the same period. The mint now holds about $5,000,000 gold reserve. At the subtreasury, on Commercial street, there are about 25,000,000 silver dollars, $12,000,000 gold, and $3,000,000 currency.

THE production of the copper mines of the United States for the month of October amounted to 36,100,000 pounds, as against 34,400,000 for September; the October production of foreign mines was 17,360,000 pounds, as against 15,556,800 pounds for the preceding month. The increase in the production amounts to 1,700,000 pounds of domestic and 1,803,200 pounds of foreign copper. The exports from the United States during October amounted to 8,510,000 pounds, as against 9,184,000 pounds for September, a decrease of 674,000 pounds.

C. HUNTLY was instantly killed near Silver City, Nevada, on the 21th. He was employed at French's stamp mill, operated by an overshot water wheel. The wheel was clogged with ice, preventing it from moving. Huntly was freeing it from the ice with a pick, when the wheel began revolving. Huntly's head and the upper portion of his body were caught by an arm of the wheel and whirled around with great velocity until his body caught between the flange of the wheel and one of the posts supporting it, crushing him to death. Deceased was a native of Illinois, aged 56.

THE twenty-five cent assessment levied by the directors of the Consolidated California & Virginia Mining Company on the 216,000 shares is the first assessment since March 6, 1894, when one of 50 cents per share, aggregating $108,000, was levied. Since then four dividends of 25 cents each, making a total of $216,000, have been paid. The forthcoming assessment, together with the bullion received, will carry them for some time. They are now going back to that part of California ground below the 1750 level, from whence they were driven by fire several years ago, when they were in good grade ore which went 60% gold.

AT the annual meeting of the Occidental Mining Company 98,423 shares were represented. The following officers were elected: George R. Wells, president; Nat T. Messer, vice-president; and H. Zadig, A. S. Wollberg and W. E. Edwards directors; A. K. Durbrow was re-elected secretary and J. H. Kinkead superintendent. The secretary's financial statement showed a credit of $2380. The superintendent's annual report shows that during the year they have driven 1590 feet of drifts, crosscuts, upraises and winzes, and have accumulated about 300 tons of ore of the average assay value of $30 per ton, none of which had as yet been milled.

SINCE the Japanese Mint was established in Osaka, the Japanese silver yen has been circulating in all Eastern markets from Singapore to Shanghai. The merchants of Hongkong have long agitated for a British dollar, and the Bombay Mint has commanded the coinage of the much-desired dollar. It is a clumsily designed affair, and has been universally condemned from an artistic point of view, but its ugliness will not interfere with its utility. The French in Indo-China, where also the Japanese yen has largely gone into circulation, have decided to assimilate the weight of the French trade dollar to that of the Japanese coin; and as the steamers of the Messageries Maritimes are required, by their contract, to carry public funds free of charge, the trade dollar can be brought to its Eastern place of circulation more cheaply than either the British dollar or the yen. With chopped Mexicans, Hongkong britannias, Saigon trades, Japanese yen and Chinese taels, the currency of the Far East is becoming somewhat complicated.

"THE Cyanide Process and the Cyanide Patents; a Guide to Relief from Royalty," is a pamphlet by G. G. Turri of Melbourne, Australia, in which the recent legal proceedings are discussed. On page 16 occurs this paragraph: "The enormous fortune the proprietors of the patent have made by royalties, and by selling rights, is without parallel in gold mining. The Mexican Cold Recovery Company paid £145,000 for patent rights in that country; and in South Africa by this time probably about half a million sterling has been paid or is payable in royalties alone. The Transvaal patent is a three-fold process, and it may possibly hold good on that ground. More than two hundred thousand ounces of gold are now extracted monthly in that one country. The royalty is 7s 6d an ounce (in some places it is said 5s are taken) and this means, reckoned that 60,000 ounces of this was cyanide gold, a royalty of over £22,000 per month, and as the battery power on the Rand is now being increased some fifty per cent, the royalty promises to be ere long $1000 per day."

THE executive committee of the California State Miners' Association met at the Palace Hotel in this city last Tuesday evening to discuss desired legislation in the Congress which meets next Monday. The bill for the examination and classification of mineral lands in this State, the full text of which was recently published in this paper, was thoroughly discussed. Some of the committee urged the immediate introduction of the bill in Congress; others thought it would be well to first see what the Southern Pacific Railroad Company thought about it, it being urged that some understanding in the matter should first be had with that corporation. The debate resulted in the selection of Chairman T. L. Ford of the legislative committee and Chairman W. C. Ralston of the mineral lands committee to submit a draft of the proposed mineral land classification bill to the railroad company for inspection, suggestions, etc. There were other matters of proposed important legislation, which will be taken up at another meeting of the executive committee to be held next Tuesday evening. Regarding the proposed congressional appropriation for construction of dams, President Neff stated that Robert Devlin, the attorney of the Anti-Debris Association, was of the expressed opinion that the farmers and valley residents were willing to unite with the miners in an effort to secure congressional aid, either by dredging or building dams under Government inspection.

Notes on Gold Milling in California.

NUMBER III.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

Stamp-Heads, Bosses, or Sockets.—They are made of cast iron or steel, of the same diameter as the cylindrical part of the shoes and dies, with two conical sockets; the upper one accurately bored out to contaiu the taperiug end of the stem, and the lower one to receive the neck or shank of the shoe with its inclosing circle of thin wooden wedges. Transverse, rectangular keyways, at right angles to each other, pass through the stamp-head at the end of the conical openings, counecting therewith iu such a manner that when hoth stem and shoe are attached to the boss they protrude into the keyways. This enahles them to he forced out hy the driviug in of a wedge-shaped steel drift ahout 1 inch wide, 18 iuches long, and tapering down from 2 inches toward the point. The ends of the stamp-head are usually reinforced hy haviug iron hands shrunk onto them.

Stems.—They are made of wrought iron or soft steel, turned perfectly true, and tapered at both ends for a distance of 6 or 8 inches. They are from 11 to 14 feet in length, the diameter varying with the weight of the stamp from 2⅞ to 3½ inches. They are reversihle, so that if one end hreaks, the other end can he used hefore sending to the shop for repairs. Wheu the repair is made, the whole stem should be annealed. The stem carries the greater weight of any part of the stamp, amounting to nearly one-half. The stems hang in the guides at even distances from center to center, aud are supported while at rest hy props or fingers catching on the under face of the tappets.

Tappets.—They are made of tough iron or steel, cylindrical, with a flange on both ends, and accurately bored through the center, a shade wider than the stem, and counter-hored at hoth ends; they are provided with rectangular recess adjoining the central hored hole, 7 to 8 inches long, and from 2 to 2½ inches wide, in which a gih is fitted. This is a piece of wrought irou or steel, grooved ou one side, with curvature one-eighth iuch smaller than that of the stem, aud planed fiat ou the opposite side. Two, or in some cases three, slots are cut through the tappet betweeu the flanges, at right angles to the stem, which counect with the rectangular recess for the gib, so that keys, when driven through the slot, press the gib against the stem, which should slide smoothly through the center of the tappet. The tappets are faced on hoth ends, and are reversihle. The keys are of steel, fitted and marked. Tappets weigh from 100 to 120 lbs. When fastening the tappet, the keys are driven in solid; but care must be ohserved, as when too tightly keyed, the tappet is liahle to split.

Cams.—They are of tough cast iron or steel, double armed, and strengthened hy a hub; which latter is frequently reinforced by having a wrought-iron ring shrunk on. The cam itself is the involute of a circle having for its radius the distauce between the center of the stem and the cam-shaft, somewhat flattened, however, at the poiut of the cam. It comprises a face from 2 to 3 inches wide, ground off, decreasing in thickness from the huh to the point, and strengthened hy a rih on the under side, which runs from a point to several inches deep at the huh. The cam is fastened to the cam-shaft by steel, hand-fitted keys.

Cam-Shafts.—They are made of wrought iron or soft steel, turned true, with double key-seats, 120° apart for cams, besides key-seats for the driving pulley. The cams are slipped on the cam-shaft with the huh side away from the stem, and keyed solidly in their respective places; they must be placed in such a manner that when the cams are raisiug the stamps, the weight is as nearly evenly distrihuted over the shaft as possible. For this reason proper attention must be given to the sequence in which the stamps are to drop in the hattery. Where the shaft is for ten cams, the followiug order of succession of drops is recommended, viz.: 1, 5, 9, 3, 7—10, 6, 2, 8, 4, and would give a drop in each hattery as follows: 2, 4, 1, 3, 5.

The cam, in picking up a stem on the under side of the tappet, imparts a revolviug motion to tappet and stem, requiring from four to six strokes of the cam to complete oue entire revolution. A too rapid revolutiou indicates the need of lubricating. The revolviug of the stem assists in giving an eveu wear to the faces of the shoes and dies, but it does not impart a grinding action to the stamp, as frequently stated, which can he proved by holding a piece of chalk against the stem duriug its ascent and descent.

Screens and Frames. — Screeus of different materials and with different orifices are used; the materials comprise wire cloth of hrass or steel, tough Russian sheet iron, English tinned plate, and, quite recently, aluminum bronze. The Russian sheet-iron plates are perforated with round holes or slots; the latter are vertical, horizontal, diagonal, or curved, and are either entirely smooth or hurred on the inner side. The latter form is intended for longer wear by closing the burrs with a mallet when too large, therehy prolonging the life of the screen. These screens last from fifteen to thirty-five days. The plates have glossy, planished surfaces, and come in sheets of 28 to 56 inches, costing in San Francisco from 65 to 80 cents per square foot. The English tinned-plate screens come in sheets of 1 to 1½ feet square; they are more flexible than the Russian iron, hence do not permit of the pulp caking along the lower edge when fed high; and, as compared with a Russian iron one of the same perforations, they give a greater discharge, hut they are short lived—averaging about ten days. The tin is burned off before using. Brass screens, costing in San Francisco 36 cents a square foot, are sold in rolls; they give the greatest discharge for an equal area, and last from teu days to two weeks, hut should not be used if cyanide of potassium be used in the hattery, on account of clogging with amalgam. The "aluminum bronze" plates come in sizes similar to the sheet tin plate, but unpuuched, the latter work being done here; they are much longer lived thau either of the other kinds, and have the further advantage that when worn out they can be sold for the value of the metal for remelting; these plates are bought and sold by the pound, and are said to contain 95% of copper and 5% of aluminum. Steel-wire screens are not much used, on account of their liahility to rust. The life of a screeu depends, aside from the manner of feeding, on the width of the mortar, the height of the discharge, and the hardness of the rock. Wide mortar and high discharge are favorable to the preservation of the screen; the form of perforations—round holes, or slots, etc.—influences the discharge area of the screen.

A good deal of confusion exists in interpreting the numbers of the different kind of screens. Wire screens take their numbers from the meshes to the linear inch, while perforated and slotted screens are numbered from the needle used in puuching them, these needle numbers being the same as are used for sewing machines. The sizes most frequently used in gold milling are from No. 6 to No. 9 of the perforated and slotted screens, and from No. 30 to No. 40 of the wire screens. The slots are from one-quarter to one-half inch long, and placed alternating or even in the rows, some being burred on the inner side.

The following tahle gives a comparison of the different varieties, with their uumbers:

No. of Needle.	*Corresponding Mesh.*	*Width of Slot. (Inches.)*	*Weight per Square Foot.*
5	20	0.029	1 15 lbs.
6	25	0 027	1.08 lbs.
7	30	0.024	0.987 lbs.
8	35	0.022	0.918 lbs.
9	40	0.020	0.827 lbs.
10	50	0.018	0.735 lbs.
11	55	0.016	0.666 lbs.
12	60	0.015	0.666 lbs.

The proper size required is a matter for the millman to decide at each mill. The character of the ore and the coarseness of the gold have to be considered, as well as the inside dimensions of the mortar; ore carrying extremely fine gold requiring a finer crushing, as the gold must he freed from the quartz matrix in part if the quicksilver is to act on it; but where this would lead to if carried out to its legitimate end may be imagined, when the writer states that he has ohserved, under the microscope, a particle of quartz that had passed through a No. 9 screen (40-mesh) and still contained several separate hut included particles of gold. Sulphide ores, having a much greater tendency to form slimes, should he crushed as coarse as permissible, and where the sulphides predominate largely, amalgamation in the hattery is hest avoided. The pulp discharged through a screen carries but a small percentage of the size of the orifice; while the largest proportion is much finer, it is possible to use a much coarser screen than the size desired to be obtained without any great detriment, while greatly increasing the output.

The Screen Frame.—It is made from strips of sugar pine 1½ hy 3 inches hroad, mortised, and reversible; usually they are made to close the entire discharge opening, grooves heing cast on the exterior of the mortar for their reception. It is frequently strengthened with one or more vertical ribs across the center opening, and is faced with iron plate on those portions of the side and hottom that come in contact with the iron keys that hold the frame solid against the mortar. In some mills the frame is made several inches lower than the opening, to permit the millmen to observe the interior of the mortar while in action, aud to allow the hand to he introduced to remove any chips that may have passed in with the ore, as these have a tendency to bank up against the screen and interfere with the discharge of the pulp. Where such a screen frame is used the opening ahove is kept covered with a strip of canvas tacked to a wooden rod, laid on the upper projectiug lid, while the loose end of a canvas hangs against the inside of the upper part of the screen frame.

(To be Continued.)

*Bulletin No. 6, California State Mining Bureau.

The Cyanide Process of Gold Extraction.

TO THE EDITOR:—I notice at the meeting of the African Gold Recovery Company, held recently, Mr. Charles McCulloch, the chairman, gave an account of the MacArthur-Forrest patent litigation, and how the patent had been made valid (according to his view) by amendment. He says "it is entirely unassailable." These are strong words and must have assured the shareholders that they had now no need to fear the consequence of further litigation as to the validity of the patent. I believe the patent now stands as if the case had never been tried; and should the company again pursue anyone for infringement, new evidence will have to be taken, and new judges will have to deliberate over the case as if the other case had never heen before the court. It is well that it should be so as the evidence given on some points in the former case requires elucidation, especially so on the point of the selective action of cyanide of potassium for the precious metals. I find in the report of the case on appeal Sir R. Webster said: "The dilute solution practically takes out the whole of the gold before it attacks the copper or other metals." Such a feat is easier said than done. I would like very much to have samples of the ore on which such superhuman action was accomplished. I have put through my hands many refractory ores, and I regret to think that this selective action is nothing less than a myth. I have endeavored to find it, but have failed in my attempt to do so. I find that when copper, antimony or zinc is in the ore (and these are the principal metals which contaminate refractory gold and silver ores and on which cyanide has a more or less active dissolving power) there is a very large consumption of cyanide, which bars the use of it for the treatment of such ores. I have never heard that the MacArthur-Forrest process has ever been run on such ores; if it has, it would he interesting to learn where, so that mining men may be posted up to date. There is another part of the case which requires very careful consideration, and more particularly in connection with the recent amendments, viz:—What is a dilute solution; where does it begin and where does it end? It has been proved to the hilt that cyanide in dilute solutions were used as solvents, and more especially in conjunction with an electric current, and also with other chemicals long before the date of the patent. Is the public now to he deprived of the use of a dilute solution, aud in the right proportions found necessary, because someone has taken out a patent for it? Are persons who used it prior to the date of the patent to be held as infringers and also those who have gone on similar lines since its date? These are questions I think can only be answered in the negative. A very interesting paper has been put into my hands hy Mr. Henry Parkes, of 237 Friern Road, Dulwich, London, discoverer of the volumetric method of estimating copper by cyanide of potassium, and used at Burry Port Copper Works, January 26, 1850 (published in the *Mining Journal* March 22, 1851), which throws quite a uew light on this question, and brings to mind the proverh, "There is nothing new under the sun." This document is in the handwriting of Mr. Henry Parkes, and is part of a specification drafted in 1852 for the late Alexander Parkes, with whom he was associated for more than 40 years in developing and carrying out numerous inventions. The late Alexander Parkes was well known as the inventor of the desilverizing process of lead by zinc, and who, in the year 1848, jointly with Mr. John Wright, were the first to apply cyanide of potassium to electro deposition. This part of the specification was dropped out of the patent sealed Novemher 1st, 1852. As this document is of considerahle interest, I quote it verbatim: "The third part of my invention consists in separating gold and silver from their ores or other compounds by means of cyanide of potassium, of sodium or ammonium or other comhinations of cyanogen, capable of dissolving gold or silver. In order to facilitate the operation I prefer that the metallic compound to be operated upon should be in a state of fine division as it is then much more readily soluble. To every ton of gold or silver ore or other compound containing one or hoth of these metals in the proportion of 20 ozs. to the ton, I add ahout 30 lbs. of cyanide of potassium, of sodium or other cyanogen compouud capahle of acting upon the metal or metals present, and from 50 to 100 gallons of water in an iron or other suitahle vessel over a fire, or otherwise heated to form 150 to 180 degrees Fahrenheit. I continue the application of heat, and gently agitate the mass until it is found hy testing that the gold or silver or hoth are dissolved—the time required varies according to the nature of the compound operated upon from one to three or more days. I now filter the solution and wash the residue with water. The solution thus obtained I evaporate to dryness, and then fuse it in any suitahle vessel, when the gold or silver or both will be found reduced, and if not fine must be refined in the usual

manner. The cyanide remaining as a flux after the gold or silver has separated by fusion can be employed for a fresh operation. *I do not confine myself to the proportions above given, as more or less of the solvent must be used according to the nature of the earthy or other impurities and also of the quantity of gold or silver or both present in the compound to be treated.* Nor do I confine myself to the above method of separating the metals from the solution obtained, as other processes may be employed, but I believe the one given to be the best. When silver is combined with sulphur or a sulphuret, and whether such compound has been calcined or otherwise treated, I prefer, when extracting the silver by this process, to boil it with the ferro-cyanide of potassium or sodium, using in this case from 100 to 150 lbs. of the ferro-cyanide to each ton of silver compound to be desilvered, the proportion of water and the method of carrying out the process is the same as when using cyanide compounds to extract the silver. The fourth part of my invention relates to the separation of silver from lead ores or compounds of lead. If the compound containing the silver is in the state of sulphuret, I prefer to calcine to get rid of as much sulphur as possible, then I add about 3 per cent. of common salt and again calcine for a few hours, in order to convert the silver present into a chloride. I now dissolve out the chloride of silver by means of a solution of cyanide of potassium or other compound containing cyanogen, prepared by dissolving 20 to 30 lbs. of the cyanogen compound in 50 gallons of water; these quantities will generally be sufficient for one ton of the compound, more or less being required according to the quantity of silver present. After the silver is dissolved out I either evaporate the solution to dryness and fuse, by which means I obtain the silver in the metallic state, and the cyanide compound will remain ready for a succeeding operation; or I throw down the silver from the solution by means of a dilute acid, as sulphuric or muriatic, and fuse with some flux or reducing agent, when the silver will be reduced to the metallic state. Other solvents may be used in a similar manner in dissolving out the silver from the calcined compound, such as hyposulphite of soda or potash." This specification contains the gist of the MacArthur-Forrest process, and had it uot been the want of a proper process for the extraction of the metals from the solution it might have been in use at the present day. The quantity of cyanide employed seems large, but it must be borne in mind that the cyanide of 43 years ago was very poor stuff. It would have been a very dilute solution if 100 gallons of water were used on a 20 ozs. to the ton orc. I recollect the late Mr. Alex. Parkes telling me that cyanide of potassium was a good solvent of gold and silver in ores, but that he wished to find some combination that would give quicker results. So far as he was concerned it was no secret, and the foregoing specification shows that his knowledge of cyanides was in marked contrast to the evidence given by some of the well-known scientific men of today, who evidently knew little or nothing about it. They seemed to be groping in the dark 50 years behind Parkes. Referring to the above italicised part of the specifications, it will be seen that Mr. Parkes was quite alive to the fact that the cyanide should be porprotioned to the work it had to accomplish. In the second claim of the MacArthur-Forrest process the cyanide is proportioned to the quantity of gold and silver in the ore estimated by assay, but no mention is made of impurities in the ore, which generally consume more cyanide than the precious metals. It is a well-known fact that if the cyanide had only to dissolve the precious metals, the quantity required would be infinitely small compared with the consumption which takes place in almost every ore. Had the above process of Mr. Parkes been employed on the South African tailings, which are so little refractory, and which have been found so easily treated with cyanide, 99% of the precious metals in most cases would have gone into solution in less than half the minimum time specified by him. The want of a satisfactory process for the extraction of the precious metals from the solution no doubt barred Parkes' process as it has done many others; and although it had since been discovered that zinc can be employed for this purpose, that is no reason why a patentee should have the monopoly of a chemical in dilute solution which had already become public property. It is interesting to notice how near Parkes was to the discovery of zinc for the extraction of the precious metals from their solutions. He had actually patented the use of zinc for the extraction of silver from silver-lead. Parkes was well aware of the fact that zinc throws down many of the metals from their cyanide solutions, and based upon this a process for depositing metals without a battery or electrical current, and which he patented provisionally. He also fouud and used as early as 1847 solutions of most of the useful metals, as gold, silver, copper, nickel, zinc, etc. by dissolving the metals directly in alkaline cyanides. It seems not to be generally known that the judges ou appeal in the German case as to the validity of the MacArthur-Forrest patent took quite a different view from the English judges, the High Court at Leipzig having cancelled the patent on appeal.

JOHN C. MONTGOMERIE.

Dalmore, Ayrshire, Scotland, Oct. 28, 1895.

Handling Refractory Placer Ground.

(Continued from page 353.)

electric power plants, because to successfully operate an electric plant of any kind, the prime motor whether it is water, steam or wind, must run at a constant speed, regardless of any variation in the load.

The differential governor, however, overcomes all tendencies to race or slow up in a manner that speaks well for its efficiency. The variations of load in this plant are often from a mere friction load to full load and back to zero in five seconds. The plant has been in operation since June 14th, and as yet there have been no weak spots or defective design found in this governor. The power is transmitted to the dredge by means of two insulated cables that are wound upon a reel at the highest point on the boat. The construction of this reel is such that it is possible to pay out or take in the slack of the cables without stopping the machinery or in any way affecting the operation of the plant. A glance at the illustration will give one a good idea of the plant, noting the general nature of the ground aud the extent to which the bars have been hydraulicked in days gone by. The method of suspending the sluice boxes is also shown. The grade is adjusted by means of chain pulleys, so that as each extra length of sluice box is added, the boxes that are already in position can be lowered or raised if the boat should be dropping astern to begin another cut. The angle through which this boat will swing is about 130°, and not interfere with the sluice boxes. The boxes can be slid over in order to dump the tailings in auy required spot. The ditch that is shown near the summit of the hill, is an extension of a ditch used by Messrs. Graves and Grater, to hydraulic the bench ground they used to own, which is located about two miles south of Bannack City. The boat was laid up for the winter on the 18th ult. The main chain of buckets is raised six feet out of the water, and the boat is run close up to an island. Cribbing is then put into support the buckets. Both auchors are dropped, and the swing lines are hauled taut. In that position the boat will remain until next spring, when operations will be resumed.

Mesh of Battery Screens.

A subscriber writes for information regarding the size of mesh of battery screens, and says: "I enclose you a copy of all the authorities I can get on the matter, and it leaves things a little confusing. What I wish to know is this: Is there such a thing as a standard by which wire or punched tin screens can be gauged? Preston and Eissler agree as to the number of mesh corresponding to number of needle, but differ decidedly from Wagoner as to diameter of orifice. Wagoner, Preston and Louis differ in almost all measurements. Eissler does not give diameter of orifice in his book. Which of the above quoted works is correct?"

In California, Too.

The papers mention the fact very prominently that a mechanic in New York got a piece of steel in his eyeball, which was drawn out by means of a powerful magnet. Why that should be heralded abroad as a remarkable operation is a mystery. Here in Idaho, where miners so often are thus afflicted by small pieces of steel from drills, they do not so much as call in a professional. They simply get a magnet and draw the steel without aid. Several such operations have been performed by the miners of this county upon their own eyes.—Idaho World.

THE matter of competition is sometimes referred to in San Francisco. Competition is evidently not wholly unknown in New York City, where last week, according to the *Electrical Review*, bids were opened for 1000 feet of insulated wire and four pounds of fuse wire, amounting to about $12.87. Thirteen proposals were submitted, and on the day the bids were opened thirteen salesmen, representiug as many wire firms, were present. Our New York contemporary omits to state to whom the contract was awarded.

Mint Director's Annual Report.

Mint Director Preston, in his annual report to the Secretary of the Treasury, issued this week, says the value of the gold deposited at the Mints and assay offices during the fiscal year was $87,482,082, of which $65,161,007 were original deposits and $22,321,022 were redeposits. The value of the silver deposited during the fiscal year was $15,714,365, of which $15,234,700 were original deposits and $479,665 redeposits. The coinage by the Miuts during the year was: Gold, $43,933,475; silver dollars, $3,-956,011; subsidiary silver coins, $5,113,469; minor coins, $712,594; a total coinage of $53,715,549. In addition to the coinage executed by the Mints during the year, gold bars were manufactured of the value of $43,153,370 and silver bars of the value of $10,841,515. The average London price of silver bullion during the year was 29 pence, equivalent to 63.8 cents. The highest price of silver during the year was 68 ccnts and the lowest price 59.8 cents. At the average price of silver bullion during the fiscal year, the ratio of gold to silver was 1 to 32.5, and the bullion value of a United States silver dollar was $0.49168. The total earnings of the Mints and assay offices during the year was $2,088,372, and the total expenditures $1,185,453, showing the net earniugs from all sources to have been $902,936.

The estimated metallic stock in the United States on July 1, 1895, was: Gold, $636,229,825; silver, $625,853,949, a total of $1,262,085,774. The estimated product of gold and silver in the United States during the calendar year 1894 was: Gold, $39,500,000; silver, 49,500,000 fine ounces, of the commercial value of $31,422,000 and the coinage value of $64,000,000. The estimated production of the world for the year was: Gold, $180,626,100; silver, coining value, $216,892,200; commercial value, $106,722,900.

The coinage of gold aud silver by the various countries of the world, so far as this information has been received for the calendar year 1894, was: Gold, $227,921,032; silver, $106,383,952.

In his report Mr. Preston gives an estimate of the approximate stock of money iu the principal countries of the world. He places the stock of gold at $4,086,800,000; the stock of full legal tender silver at $3,349,300,000; stock of limited tender silver at $631,200,000, making a total silver stock in the world of $4,070,500,000; the uncovered notes are placed at $2,469,500,000.

Mr. Preston, in a review of the monetary legislation of the country, states that the real demonetization of silver took place in 1853, when the weight of the divisional coins was reduced about seven per cent. This, he says, was not an accident nor oversight. It was expressly declared in the House of Representatives that the intention was to make gold the solid standard of value in the large transactions, and silver subservient to it, for small ones. The act of 1873, he says, was only nominal.

In his report the Director of the Mint says that the result of the currency legislation of the United States for over 100 years has been such as to leave an incoherent monetary system as incousistent, illogical and expensive as can well be imagined, that inspires little confidence at home and is not conducive to our credit abroad, and its reform is one of the most important and urgent political and financial questions of the hour. He says that on January 1, 1879, the date of the resumption of specie payments, the only currency, except coin certificates, required to be redeemed in gold coin was the $346,-681,016 legal tender notes then outstanding, which the then Secretary of the Treasury was of the opinion that a gold reserve of $100,000,000 would be sufficient to maiutain, but the paper currency redeemable on presentation has been increased to the extent of $155,930,000 issued in payment of the silver bullion purchases under the act of July 14, 1890. Besides these, there were outstanding November 1, 1895, $333,456,236 in silver certificates, and as the act of July 14, 1890, declared it to be "the established policy of the United States to maintain the two metals at parity with each other," there was now a total of $621,229,532 resting on the basis of the gold reserve of $100,000,000.

HERE is Huxley's definition of a liberal education: "That man," said he, "has a liberal education who has been so trained in youth that his body is the ready servant of his will and does, with ease and pleasure, all the work that, as a mechanism, it is capable of; whose intellect is a clear, cold-logic engiue with all its parts of equal strength and in smooth working order, ready, like a steam engine, to be turned to any kind of work, aud spin the gossamers as well as forge the auchors of his mind; whose mind is stored with a knowledge of the great and fuudamental truths of nature and of the laws of her operations; one who, no stunted ascetic, is full of life and fire, but whose passions are trained to come to a halt by a vigorous will, the servant of a tender conscience; who has learned to love beauty, whether of nature or of art, to hate all vileness, to respect others as himself. Such a one, and no other, has had a liberal education."

Mining Summary.

CALIFORNIA.

Amador.

PINE GROVE.—E. A. Trask is reported to have $50 ore in his tunnel. It is expected that the Wieland mine will soon resume. The Reward mill is turning out considerable bullion.

THE KENNEDY.—Recently discovered ore bodies on the 1050 level of the Kennedy have increased the output, which last month is set at $40,000 in free gold alone.

IRON MASS, VOLCANO DISTRICT. — *Ledger:* The Iron Mass people are making arrangements to crush 1000 tons of ore at the Acme mill, which is about two and a half miles from the Iron Mass.

THE CLINTON, CLINTON DISTRICT.—A company is arranging to reopen the Clinton Consolidated mine, which has been shut down for the past three years. Supplies have been ordered for continuing the work throughout the winter. The shaft is now down 336 feet, and work will be commenced on sinking just as soon as the machinery can be overhauled and supplies placed on the property. The present work is in the hands of Dave Gutman, and he proposes to sink the mine 300 feet deeper before the ledge matter is disturbed.

Butte.

GOLDEN FEATHER. — The general manager writes the company: "After repairing the damage caused by the storm and getting back into the claim, some very rich gravel was struck among the boulders adjoining the bulkhead on the east side of the river, going as high as twenty-five cents to $1 to the pan, but we had driven only a short distance up stream before we came into the narrowest gorge we have yet found in the river, and this gorge was literally packed with enormous river boulders, and the rock wasted into the river during the grading of the old Union Cape flume-bed. Our predecessors had driven a sluice-way underneath the large boulders, which they had blocked up with 12x12 timbers and large posts, and it is evident they were using every exertion to reach the stretch of river immediately ahead of us, and which has at all times been regarded as the cream of the claim. That they were driven out before reaching this ground is proven by the presence at the up-stream face of the gorge through which they were driving of an enormous boulder, which they evidently had not time to blast out. The interstices of the rocks and the underlying bedrock carried rich gravel, through, of course, limited in extent, yet we cleaned up from a distance of about 25 feet nearly $4000. The gorge in the center of the river bed was evidently cleaned out by our predecessors. The weather has been remarkably warm for this season of the year, averaging at noon throughout the past week 95°, and there is every evidence that we will have a long open season. Should this be the case we will undoubtedly get into the open stretch of river ahead of us and work some very rich ground, the richest, probably, in the claim. It is needless to say that we are doing all in our power to accomplish this. We have got the claim in as perfect a shape as it is possible to get it, either for the rapid working of the new section, or to get out without damage and loss should the winter storms set in suddenly."

Calaveras.

THE GWIN MINE.—At the Gwin mine the shaft is 1050 feet deep: the crosscut in the 1000-foot level is in 60 feet and the south drift 30 feet. A ten-inch hole will be drilled down from the bottom of the shaft 250 feet, which will make 1300 feet from the surface. The object is to tap any water in the drifts that may have been run from the old shaft. If the 250 feet of drilling does not tap water, then fifty pounds of dynamite will be exploded at the bottom of the hole, and if no water is tapped then the work of sinking the shaft will be resumed.

THE LONE STAR.—The *Prospect* hears that all the back indebtedness on the Lone Star mine at West Point will soon be paid up and operations resumed in the mine.

NEW ROASTING PROCESS.—At the Scorpion mine, at West Point, A. D. Glace of Oakland is trying a new process of his invention on some rock from the Black Wonder, on Blue mountain. The rock is first run through a fine rock breaker and from there into a set of rollers, where it is crushed, then goes through a chute, a round rotating screen and into a roaster where it is roasted by the superheated steam, then ground finer and passed into the amalgamator, where the bullion is secured.

El Dorado.

IN THE VICINITY OF PLACERVILLE.—(Special Correspondence)—The Pine Hill Gold and Silver Mining Co., composed of South Franciscans, are operating extensively in Gold Hill mining district, nine miles from Placerville. They have a shaft down 150 feet, exposing a large ledge of fine ore. A contract has just been let to continue the shaft 150 feet farther. The ledge will be crosscut again at the 300-foot level. A 10-stamp mill will be erected on this property within the next sixty days, and the owners contemplate enlarging the mill to 60 stamps in the early spring.

The Big Canyon, or Oro Fino, mine is now crosscutting on the 500-foot level with flattering prospects. The 30-stamp mill is being run continuously with satisfactory results. They are milling all the ore between the walls, 90 feet wide, without selection. Also, the main shaft is being sunk below the 500-foot level. This property is owned by Hayward & Lane.

The Church mine is situated about nine miles from Placerville. The mill has been running constantly for many years on high grade ore, and yielding very satisfactory results to its owners. They are now putting in a new hoist on the 1200-foot level, to be run by compressed air. This property is owned by T. Church, Senator Perkins, Hon. J. H. Neff and others.

The Grand Victory mine, situated five miles from Placerville, has just started a new 20-stamp mill, and will soon add 30 more. Their ore body is over 100 feet in width. A recent development was made, in crosscutting from the lower level, of rich ore, which brings the Grand Victory mine to the front among the best gold mines of the State, and she will no doubt soon be heard from in the way of bullion shipments.

The Salisbury mine, which adjoins the Grand Victory on the south, is considered a very promising property and will take rank in due time among the best paying mines in the county.

The Taylor mine is still turning out plenty of the yellow metal, and the 40 stamps are kept continuously going.

The Gentle Annie mine is situated about two miles from Placerville. They have a 10-stamp mill that has been running continuously for three years, making a regular monthly shipment in bullion. The proprietors of this mine, Messrs. Meltou & Carlow, own fourteen claims, known as the Gentle Annie group of mines. Most of these claims were worked with varied success during the early days of California. The 300-foot level in the Gentle Annie has just been opened, exposing a large body of high grade ore.

In the canyon below there was a tunnel started many years ago to cut this property at a depth of 900 feet. After being extended 650 feet it was discontinued until the present time. Within the past week work has been resumed in this tunnel and will be continued until it cuts all the veins in this group of mines, a distance of 1400 feet. The tunnel cuts about 100 feet of roofing slate, near its mouth, of as fine a quality as is found in the State. The gathering of these properties into one group (combined with this tunnel) on the part of J. Melton is considered one of the biggest plans of the kind on the coast.

The 10-stamp mill belonging to T. Clarke and others, three miles from Placerville, is making its regular weekly clean-up, and is considered one of the best paying mines in the State, of its capacity.

The 10-stamp mill started near Grizzly Flat, three weeks ago, by J. Melton is doing exceedingly well.

Fresno.

RIVER MINING.—Captain Barrett's scheme, referred to at considerable length in these columns some months ago, is about completed. He has dammed the San Joaquin river and will change its course to drain a pool at the mouth of Fine Gold gulch, which has been long believed to hold considerable gold.

Lassen.

QUARTZ MILL SOLD.—The Bank of California has sold the old Monitor mine quartz mill to the owners of the Hayseed mine at Hayden Hill, Lassen county. The Hayseed mine is considered an important mining proposition.

Mariposa.

THE LOUISA.—*Gazette:* On the Louisa, sinking operations are being pushed vigorously. The shaft is down about 300 feet. There are three crosscuts—two on the 200 level and one on the 100 level. A drift is also being run on the 100-foot level. For ventilation purposes, a winze is being raised from the 200 level to the 100 level.

MERCED G. M. CO.—The new 40-stamp mill of the Merced G. M. Co. is about ready to begin operations. General Manager Couch, who is now in this city, is credited with intention to build a 500 (?) stamp mill if results from the 40 stamps come up to expectations. In that event, there would be a $500,000 assessment on the stock.

Nevada.

AT MEADOW LAKE. — Miners at Meadow Lake are doing assessment work. Active work will begin next spring on the mine sold by John Clark and his partner to Salt Lake parties. Lumber has been hauled to the mine for the mill to be erected as soon as the snow disappears.

THE GERMAN. — *Herald:* Superintendent Cooley has twelve men at work in the German mine, above Washington. They are now making an upraise from the lower tunnel to the upper tunnel.

LE MARQUE MINE.—Thompson and Maltman show some ore from the Le Marque mine from the depth of 260 feet—ribbon rock full of sulphurets and a sprinkling of free gold. The Le Marque is close to the North Star.

Plumas.

FIVE HUNDRED DOLLARS A DAY.—*National-Bulletin:* Before closing down the Kittle mill for the winter, Standert & McGill realized $500 a day for twenty-five days, on ore from their big quartz mine below the Round Valley reservoir, near Greenville, a profit resulting from the operation of 15 stamps.

THE FREN SCOTT MINE.—In this drift mine, on the North Fork of Feather river, during the past few months, a wide deposit of gravel, an ancient river bar, was passed through, and now the channel seems confined within narrow limits. The drift is now 500 feet up the channel. About twelve men are now employed and will be during the approaching winter. This mine is a part of the Big Flat channel, one of the most extensive in Plumas.

INSPECTING DAMS. — *Independent:* U. S. Debris Engineer Gillette has inspected the ground of the Plumas Blue Gravel Mining Co. at Nelson Point. The company is preparing to put in a substantial dam under the direction of the Debris Commission and once more place this valuable property in active operation. The ground was surveyed by Engineer Vischer some weeks ago and the lines of the proposed improvements established. A permit to work has been granted. Lieutenant Gillette also inspected the dam being constructed in Onion Valley creek by the Good Hope Company, and finding it not up to the requirements of the Commission refused to accept it until it has been raised several feet in height.

An eastern company, who have acquired the claims owned by Orr and Gard and the Upper Rabbit creek or Dutch claim, have constructed a restraining dam in Rabbit creek below the La Porte bridge 30 feet high and 220 feet long, which has been inspected and approved by the Engineer. J. H. Thomas, a former resident of Plumas county, is superintending the refitting and equipping of this property preparatory to a run next season, which it is believed will prove a successful one, as these mines when formerly worked were dividend paying.

Placer.

THE BLACK HAWK BONDED. — *Republican:* The Black Hawk gravel mine, near Forest Hill, has been bonded to a syndicate of San Francisco gentlemen for $40,000. This mine is the property of W. A. Freeman and the W. C. Wallace estate. Work will be commenced immediately on the mine, and no doubt the transfer will be made in due time. The mine promises to be a good one as it is an extension of the Mayflower.

THE MAYFLOWER.—At the Mayflower gravel mine a further ten stamps will shortly be added, making thirty in all. The mill has now been running about a month with the new battery. It was shut down for but twenty days, during which the entire change of machinery was made, under the management of Mr. L. I. Ogden of Forest Hill.

THE EUREKA.—At the Eureka Consolidated, which gives employment at present to fifteen men, all is activity. The tunnel, 6½ feet square, is now in 220 feet out of the 1800 feet which will have to be run before gravel is expected to be struck. Three Burleigh drills will shortly be installed, driven by Rix & Firth compressors, which will considerably expedite the work. All supplies necessary to last through the winter have now been delivered at the mine.

San Bernardino.

THE ALTURA.—Supt. Maude has started the new ten-stamp mill of the Altura near Victor and has opened a body of $20 ore on the 200 ft. level.

San Diego.

PROSPECTS PURCHASED. — Messrs. Dorsey and Grant have been examining gold mines at Picacho and in the White Gold Basin, twenty miles above Yuma, on the Colorado river, and are reported to have purchased the Mura Rica and Dulcina group. Messrs. Selleck and Gaines of New York have options on twenty-one mines in the Picacho Basin and ten in the White Gold Basin. The three companies have a project to build a narrow-gauge railroad from the mines, four and one-half miles, to the Colorado river at Picacho, where the ores from the mills will be crushed. The ores are low grade, but free milling.

(Special Correspondence): The most important mining trasactions ever consummated in Southern California were those made this week whereby United States Senator Stephen W. Dorsey and associates secured the Mina Rica group of mines at Picacho on the Colorado river, twenty miles north of Yuma, in which the rich strike was made some three or four months since. The group consists of the Mina Rica, Dulcenia, Apache, Rica Tierra, Easteru California, and eight others, which adjoin and nearly surround the Dr. Jayne groupe, consistiug of the Mars, Venus, and San George, which have turned out so much gold. The second transaction of note was that by which Jesse R. Grant and associates have secured thirty of the most promising mines in the White Gold Basin, lying two miles east of the Picacho basin and from one to two miles back from the Colorado river, which they will at once prospect, open up and develop.

The third deal was made by H. F. Selleck and E. A. Traves, of New York, by which they bonded twenty-one mines in the Picacho and ten in the White Gold basin, upon which they already have a force of miners at work opening up ready to supply ore for a large mill which they will erect on the bank of the Colorado at Picacho.

Senator Dorsey and associates will construct a narrow-guage railroad from their mines, 4½ miles to the river, at Picacho, where they will at once erect a 100-stamp mill. Selleck and Traves will join them in building the railroad. These three deals, all made during the week, involve an outlay of more than a million dollars at Picacho within the next six months and the opening up of this gold belt.

Wm. A. Farrish, with a force of thirty-four miners, spent seventeen days in experting these properties. He experted the Dr. Jayne group some years since, and was not a stranger to the formation of this mineral belt.

Judge A. B. Richards, one of the owners of the Pueblo smelters, and C. L. Josselyn, of San Diego, have bought some seven or eight very promising claims.

J. L. Curtis and associates have also secured some twelve or thirteen promising properties. Mr. C. is from West Virginia.

J. M. Hay has two fine claims in which Denver parties are interested with him.

Mr. Farrish and Senator Dorsey found in their examinations that the strike made in the Mina Rica mine exteuds into the Dulcenia and crosses the Fleetwing, West Goshen, and runs into the Del Mar mine, and that on the first two it covers an area of 1200 feet in length by more than 400 feet in width.

Thirty-four miners were employed during the examinations of nearly three weeks by Mr. Farrish in crosscutting the veins, clearing out the old works and in opening new ones, and in prospecting and testing the ores, the samples covering more than one hundred tons of different ores from the different veins and mines, the result of which has been to convince the mining men present that the Picacho mines, in the tests made, more than confirm all that has been said of them. Senator Dorsey and Mr. Farrish left for the East and Mr. Grant for San Francisco, but will return in December, when more active operations will be commenced.

Shasta.

WILL DEVELOP THE PROPERTY.—*Free Press:* A. A. Anthony has resigned as superintendent of the Central mining property in Old Diggings; R. G. Hart succeeds him. The mines were recently patented by the owners, Whitehouse & Bliss of New York.

Sierra.

DRIFT MINES NEAR DOWNIEVILLE.—A correspondent of the Downieville *Messenger*, in advocating a new road to the district north of that town, says of the mineral resources thereabouts: There is a lava-capped channel reaching from near the Four Hills down to Brandy City. It is mostly inaccessible on account of no roads, but is being developed a little. There is the Jones Brothers mine, now called the Sunnyside, where they took out thirty thousand dollars in one year from a small piece of ground, in nuggets ranging in value from nine hundred dollars down to the size of your thumb. The Gibraltar is pushing a tunnel into the same channel. Also the Forest Queen and others. This channel is on the divide between the waters of Canyon creek and the North Yuba. Then between the waters of Canyon creek and Slate creek and running parallel with the streams, is another lava-capped channel that has yielded millions of dollars and is only prospected. This channel, as far north as it has been traced, goes from Mount Fillmore down to Howland Flat, St. Louis, Port Wine and Scales. Then another still, that parallels the first two, and is between the waters of Slate creek and Feather river, extending from Pilot Peak down to Gibsonville, Thistle Shaft, La Porte and so on. All the above named channels are only partly developed, and wherever they have been, without an exception they have yielded up their golden treasure in millions of dollars.

THE ALASKA SALE.—The Alaska mine at Pike City has been sold at assignee's sale to an English company, and is now being fitted up for proper working by its new owners. The head of the new company on this coast is K. B. Soule, manager of the Lick House. The business manager of the new company, R. Payne, London, was at Downieville last week. The *Messenger* says it is understood that $50,000 is the true purchase price of the Alaska and Grizzly mines, of which $10,000 were paid in cash upon the debts of the old company, and that the other $40,000 were taken in stock in the new company by the holders of the mortgages upon the property and by the former owners. Frank Kewis, who was foreman under the original Alaska Company when it could not by reason of defective pumps work the rich pay at the bottom of the mine, is in charge under the new company. It is not the purpose of the new company to operate very extensively until the opening of spring. But they intend, ultimately, to drain the 400-foot level where gold is known to exist in great quantities, but which hitherto could not be worked on account of water. The attorneys for the creditors and lien claimants of the preceding Alaska company were busy last week distributing the $10,000 paid upon the indebtedness of the former company. The assignee's sale of the Grizzly mine took place last Wednesday.

Siskiyou.

ASSESSMENT LEVIED.—The Siskiyou Consolidated Mining Co. has levied an assessment of 1 cent per share, delinquent December 19th.

Trinity.

THE ALTOONA MINE.—The Altoona Company has 100 men employed; eighty flasks of quicksilver were brought to Redding on the 15th inst.

AT TAYLOR'S FLAT.—*Journal:* Pelletreau & Hedges have finished a ditch 1¼ miles in length, with a capacity of 500 inches, from Snow gulch to their placer mine, the Highland.

E. Van Winkle, in his drift claim at Little French Bar, has a ditch taking water from Little French creek, with which he supplies water to run an undershot wheel with hydraulic pressure. The water power operates two pumps, used in draining the mine, also hauls the car taking out dirt up an incline, where it is dumped into the sluices. The tunnel is in forty feet and the ground averages $1 to a carload (about three wheelbarrow loads). Four men are employed, and he is averaging an ounce of gold a day to the hand. The lead is about 65 feet wide and is known to extend 400 feet.

Tuolumne.

PROPOSED ELECTRIC POWER.—*Democrat:* The Sonora Electric Light Co. have under consideration a scheme to build above Duckwall canyon a reservoir for water to run an electric plant, from which power is to be furnished for mines above Sonora. The cost of a 75-foot dam at the outlet, the only expense attached to the water storage part of this enterprise, will require the expenditure of $12,500. When completed the storage capacity of the reservoir would be 75,264,000 cubic feet. A dam 100 feet high, at a cost of $20,000, would increase the capacity to 220,000,000 cubic feet. It is proposed to pipe the water from the dam down in the Duckwall canyon to the north fork of the Tuolumne river, where the electric plant will be located.

NEVADA.

HUMBOLDT COUNTY.

KENNEDY DISTRICT.—The Gold Note group of claims in Kennedy has been sold by the Shamrock Company to J. A. Blossom, of Battle Mountain. The sale covers the forty tons of ore on the depot platform for shipment, which will go over $100 per ton.

OREGON.

A Kirbyville paper says at the Mayhelle group of placer mines on Chetco one hundred men are at work digging ditches and doing

other development work. About forty pack animals are run out of Kirbyville every three or four days, carrying supplies and machinery for a double circular saw-mill in course of construction. A portion of the freight for the mines comes via Crescent City from San Francisco.

F. Mallory of Spokane, Wash., has bought two claims owned by W. P. Russell of Spokane and B. B. Shepherd of Baker City for $22,000. The claims are located in the free milling or Virtue district, six miles northeast of Baker City. There is a seven-foot ledge of free milling ore. Mr. Mallory will put in a stamp mill as soon as possible.

JOSEPHINE COUNTY.

The Siskiyou copper mines are fifteen miles northwest of Kerby. Forty men are employed ten putting a bridge across the Illinois river. The smelter is expected to be in operation in three weeks. Six hundred tons of ore are now ready to be reduced. A shaft is being sunk on or near the mouth of the tunnel. The ledge is exposed 60 feet in length. J. H. Simmons is foreman, W. H. Wood metallurgist. The smelter will treat 30 tons per day. It has four tons capacity. The blower will furnish a blast for six furnaces, should they be put in. A 16-foot overshot water wheel, three feet abreast, is ready to run; the water is from Fall creek. Special mention should be made of the fluxness of the copper run—60 per cent. Two hundred and fifty bushels or charcoal will be required per day to keep the blast going.

The Elmer Brown copper mine is a new development, five miles southeast of Waldo. A double compartment shaft is being put down. A tunnel is being driven into the opposite hillside. The ore is a carbonate. The vein shows 25 feet wide between walls. Fifteen men are employed. Two dollars per day and board is paid. Robt. Brown is superintendent.

MAY BE OVERRULED.—(Special Correspondence)—Allow me to call the attention of the mining public to the recent decision of the Circuit Court of Josephine county, Oregon, relating to the title to the beds and bars of rivers in the mining region. Your issue of the 23rd inst. contained the notice which I saw of this most remarkable and absurd decision against the mining interests. It was decided, among other things, that the holder of an agricultural patent fronting on the river is entitled to the land to the edge of the "thread" of the stream, or all that part of the channel above high-water mark not actually cover by running water; and this, too, notwithstanding the acknowledged fact that the meander line of the U. S. survey follows high-water mark on each bank. The space, including the bars which are valuable for mining only and of no earthly use to the agriculturist, are thus given bodily to the farmer who won't work them and taken away from the miner who will work them for his own benefit and that of the community. The commonsense view of this question is that the channel of a river between the meander lines of the government survey on each side belongs to the public domain and is therefore open to location for mining purposes. And there is no part of the public domain so free from dispute as to its mineral character as this. There is not a shadow of a chance to claim that it is of more value for agricultural than for mining purposes. It is occupied by bars of sand and gravel and the "thread" of the stream at low water, and is entirely covered by a running current of water—the "thread" of the stream—during the period of high water. Suppose a stream of running water is 200 feet wide at its lowest and 600 feet wide at its highest stage when the "thread" reaches the high-water mark or meander line on each side. This glaringly absurd and partial decision gives all this valuable mineral ground between high and low-water mark to the farmer who has no use for it and don't want it until the miner proves it to be valuable to somebody. The established policy of our government to reserve from agricultural patents all land known to be valuable for mining purposes, is entirely ignored or overruled by this wise decision of an obscure court in Oregon, rendered so boldly in favor of a class who constitute the majority in that locality, and so manifestly contrary to justice and common sense.

WASHINGTON.

THE GOLDEN CHORD. — The Golden Chord mine, Monte Christo district, is again started. The ore is being hauled from the lower terminal of the tramway to the Everett and Monte Cristo railroad and shipped direct to the smelter. The estimated output is 150 tons a week for the present.

BRITISH COLUMBIA.

AMERICAN MONEY DID IT. — President Denois, of the Northwest Mining Association, in an interview in the Chicago *Inter-Ocean* is credited with saying that the Pilot Bay smelter was built by British Columbia capital. New England money built the smelter and bought the Blue Bell mine.

PROPERTIES BONDED. — The option on the Cliff at Rossland expires December 1. At that time the Barnard syndicate must pay S. M. Wharton $34,000 or the bond is forfeited. Mining men from Rossland are of the opinion that the payment will be made.

The Margaret and Violet mines on Tiger creek have been bonded by George Gloyn to the Montreal and British Columbia Mining and Promotion Company for $15,000; the bond expires June 1, 1896.

QUESNELLE FORKS.—The Horsefly hydraulic has close for the season and the men have gone to Ashcroft. The last clean-up yielded $5,000 or $6,000, making $55,000 or $56,000 for the year, and as operating expenses were about $7,000 a month, for the first year the returns are considered good. Everything is in readiness to start washing as soon as the frost is out in the spring.

AT AINSWORTH.—The Number One mine at Ainsworth, which was recently closed down, has resumed with a decreased force.

ALASKA.

FLATTERING REPORTS. — A strike is reported in Birch Creek district, on a small stream three miles below Mastodon creek. The discoverer says in two and a half days he washed out $130 with a gold pan, his largest nugget weighing $53. Glacier creek has turned out about as much gold this season as any creek in Birch Creek district. On the Pelkey claim twenty-two men, each with a gold pan, made a novel test of its richness. They all began work at the same instant and in one hour's time they panned out $4000; the lowest amount taken by any man was $34.

C. K. Zilly of Seattle says: "I have been working in a mine on Mastodon creek, which is a tributary of Birch creek. There are fifty-four claims on Mastodon creek, and, I should judge, twenty or twenty-five are opened up. This is the first season on that creek, and I estimate that the miners took out about $150,000 to $200,000. It is all placer mining. They began early in June and worked until about September 10th, when the frosts began to interfere."

IDAHO.

PAY-DAY AT WARDNER.—The 15th was day-day for the Bunker Hill Company. Nearly $40,000 were distributed among its employees for October labor. On the 20th the Last Chance Company paid about $11,000.

MAMMOTH MINE.—The Mammoth mine, in Summit Flat, in southern Idaho, has recently been sold. The mine has been thoroughly developed at a depth of over 300 feet during the past two years. The ore will mill from $35 to $40 a ton and the vein is from 12 to 14 feet in width.

AROUND PIERCE CITY.—(Special Correspondence)—Pierce City, famed in earlier days for its placers, which in some gulches paid as high as $300 per day, is now showing all indications of being as rich in quartz as it was in placer. There are two mills in operation. Dunn Bros. & Carr own the Democrat mine and other property on Barclay gulch, on which they have a three-stamp mill running continuously, with two shafts in the mine. This property adjoins Dr. Bole's former property, which recently was sold to a Cœur d'Alene Co. for $30,000. First payment was made in August, and it is generally understood that the new owners will commence work either this fall or early next spring.

A good showing for a big mine is on the Idaho mine, owned by Messrs. Miller & Sevey. The vein on top was 7½ feet wide, but it narrowed down to about 3 feet of ore in the first 20 feet; it is free-milling ore and will average between $20 and $30 per ton, picked samples going over $200 per ton. The owners have finished a four-stamp mill, which is now running. A 20-horse power engine furnishes power.

All the discoveries made in this camp have been made in the washed-out placer gulches. There are over 300 men at work on the placers here, making fair wages. Messrs. Coonin & Alvord have very good diggings, which pay them from $8 to $12 a day to the man, shoveling into boxes. Messrs. Howes & Sutherland for the last two years have been putting in a bedrock flume to work Oro Fino creek. They have had a crew of ten men and over all the time. They expect to strike pay ground early next summer.

STRIKE IN THE MORNING STAR. — A rich strike is reported in the Morning Star mine, near Silver City. In the 400-foot level a body of ore was encountered. The pay streak is five feet wide and assays $300 a ton gold.

MONTANA.

EXTENSIVE IMPROVEMENTS.—The Boston & Montana Company will make extensive improvements at the Great Falls smelter and construct new machinery. It is said since the Butte & Boston have been consolidated with the Boston & Montana, it has been decided to abandon the smelter of the former at Butte and have all the ore treated at Great Falls, but such report is not confirmed.

SOUTH DAKOTA.

COPPER MINING COMPANY.—*Pioneer:* Articles of incorporation were filed Saturday for the Black Hills Mining and Smelting Company, with a capital of $500,000; headquarters at Hill City; incorporators, J. H. Scheneck, Sheridan, S. D.; W. J. Highlands and S. P. Dunn, Cleveland, O.; W. B. Gamble, Akron, O.

THE MOFFITT PLANT.—*Pioneer:* It has been a tedious job to put in the fixtures and machinery at the Moffitt plant at Pluma, as the old building, erected origiually for a cyanide, had to be almost completely remodeled; but it will be running by December 1st, as a great share of the work has been done. Nearly all of the machinery was invented and designed by J. R. Moffitt, and put up at the E. F. Cadle & Son's iron works, at Stockton, Cal. The ore crusher is one of Mr. Moffitt's productions. It has a capacity of forty to fifty tons a day, and crushes the ore to a twenty-mesh fineness; the ore will then be carried by an elevator to the oxidizer, which is capable of handling twenty-five tons per day. From this vat it is carried into a pulverizer, where it is ground into a floury fineness, thence it is conveyed upon the plates. The pulverizer has such a motion that the particles of leafy gold are changed into tiny globules, so that nothing will float away over the plates. One hundred tons of Golden Summit ore is stored at the mill, awaiting the start.

UTAH.

PARK DISTRICT.

NOT "A POOR MAN'S CAMP."—Speaking of the recent glowing reports that have been published in regard to the Camp Floyd district, Geo. Kislinghury states to the S. L. *Tribune* that there was but one feature of the boom that he deplored. "There are plenty of men who read the reports that Mercur and the adjacent country are booming, who go to the district without capital and frequently without money to exist on, expecting that it is a poor man's camp, and that in the course of a month or two they will be able to make a stake. They are of the usual floating mining population, expecting to get work at day's pay for awhile, become familiar with the district, and later go out and make a location that will make them rich. I want to say right now that there are no mines sticking out of the ground in that district, and more, that mines that are now developed furnish employment to a given number of men only, and work for day's pay is not as plentiful as is usually supposed. I consider that the supply of skilled mining labor in the district is right now equal to the demand that will exist next June, a time when I believe the camp will furnish employment to nearly 1000 men."

WYOMING.

NEAR SHERIDAN.—Another of the Tremain steam stamps is to be put to work crushing the cement of the Bald Mountain gold district, near Sheridan.

A NEW COMPANY.—The Standard Prospecting and Mining Company of Chicago has incorporated at Cheyenne; capital stock, $5,000,000; incorporators: J. R. Toomer, H. W. Ayres, H. C. Core of Chicago. The company will develop mining properties in Wyoming.

ARIZONA.

GILA COUNTY.

John Kasser, mine superintendent of the Kusser Gold Mining Co., tells the *Bell* that their trial mill-run of seventy tons of ore, sixty tons being low-grade, yielded between $500 and $600. A meeting of the company will be held in New York next week to consider the proposition of adding ten stamps to the mill, thus doubling its present capacity; also to lay a three-inch pipe one mile and a half to bring water to the mill. The mill is now running.

YAVAPAI COUNTY.

WHAT IS IT REALLY WORTH?—*Journal-Miner:* The announcement of a $300,000 deal having been consummated in London on the Leland Stanford and Snipe mining claims, on Groom creek, created considerable surprise. A deal of that magnitude on claims which had never been heard of by three-fourths of the people here was, in fact, enough to create surprise. The *Journal-Miner* was not aware of there being any $300,000 properties lying around loose, and never having even heard of the existence of the above claims had to institute an inquiry in regard to them. The result is that it was learned that the claims formerly belonged to a man named Nick Shlumberger; that he has sunk fifty or sixty feet on the claims without finding anything of value. A man was found who said he had been offered these claims some time since for a horse, as the owner wanted to get out of the country. If these are the facts in the case, it seems incredulous that the prospect holes could ever have been sold for the price named; and if such is the case, it is a serious thing for this country. Men are engaged in trying to secure capital for legitimate mining enterprises, and the unloading of properties of no value whatever on men of means in London will have the effect of giving a black eye not only to this particular section, but to Arizona in general. No words of too severe condemnation can be meted out to any party who will attempt to perpetrate such a fraud for the few paltry dollars benefit that may be individually obtained from it.

COLORADO.

A NEW MINING CAMP.—The new mining camp of West Creek is situated about eight miles northwest of Maoitou Park. A large number of claims have been staked and 500 people are in camp, and busy doing assessment work.

The country is an easy one to prospect to one who has learned to know the rock, which is not the same as Cripple Creek, though the locality is not very far from the camp. The veins crop to the surface very distinctly, and run parallel to each other, so there are no very serious conflicts in the numerous claims laid out. Several assays have been made on ore taken a few feet from the surface. Some ore has been found containing free gold and some with sylvanite.

AT LA PLATA.—The Hayden Mining and Milling Co., composed principally of Chicago capitalists, has bought the J. M. & E. and Double Standard Company's interests in West Mancos. The first-named company had before refused upwards of $100,000 for their holdings; next spring 100 stamps will be added to the twenty-stamp mill now completed in West Mancos.

NEW MEXICO.

A DRAWBACK.—J. D. Hughes, business manager of the Santa Fe *Daily New Mexican*, says: "We don't have a great deal of mining news. There is plenty of good territory, no doubt, but it will never be prospected thoroughly until these land grants are settled. There is no use of a man going to work and hunting out a mine when it may be taken away from him. As soon as these grants, that are plastered all over the State, many of them fraudulent, too, are settled, New Mexico mines will come to the front, and the other resources as well."

THE WASHINGTON MINE.—The District Court at Albuquerque has dissolved the injunction that has kept the Westinghouse mine idle for nearly two years. This is the biggest mine in the Cochita district. The owners will begin taking out ore at once.

VENEZUELA.

SERPENT'S MOUTH, ORINOCO RIVER.—Several hundred miles up the Caroni river is the El Culloa gold mine, producing annually 90,000 ounces, $24 to the ton. From a vertical shaft 1450 feet deep are run various tunnels, in which work 300 natives, the mine being in charge of Americans throughout.

Coast Industrial Notes.

—California exhibits have won seventy-five medals and premiums at the Atlanta Exposition.

—To build the Washington State Capitol at Olympia Keenan of Spokane made the lowest bid—$944,000.

—The most recent result of the rate war between the Oregon railroad and the Oregon steamship companies is a 60% reduction of freight rates by rail, an enormous amount of travel on both lines, and a statement from both sides that they are making money.

—January 1st, '96, the Lower California Pearl Fishery Company, which holds all concessions from the Mexican Government for pearl fishing in the Gulf of California, and off the coast of the State of Oaxaca, will move headquarters and all business from La Paz to Guaymas.

—The Vulcan Iron Works of San Francisco are constructing a Vulcan Wire Ropeway at Empire, Nev., to convey 100 tons of tailings daily, for treatment at the Morgan Mill, also, a Vulcan Ice and Refrigerating plant for the steamship Colon, and an ice-making plant for the Hawaiian Islands.

—Considerable was said some months ago about the International Exposition of Industries and Fine Arts, authorized by the Government of Mexico, but the enterprise seemed to languish. This paper is now informed that the formal opening of the exposition will take place September 15, 1896.

—During October there were shipped over the Northern Pacific Railroad from the State of Washington 565 cars of lumber and 707 cars of shingles. The September shipments were 1232 cars. Cargo shipments from the twelve principal cargo mills of the State for October aggregate 9,973,054 feet lumber shipped to foreign ports and 17,381,141 feet to domestic ports.

—A sharp demand for California wheat from Australia and South Africa is a new factor in the local grain trade, hitherto excluded from all calculations. Five sailing ships are now under charter for Australian ports and for the Cape of Good Hope. This represents at least 25,000 tons. In addition, all the steam freight accommodation to Australia for the next four months has been engaged.

—The Kaslo and Slocan railway is completed. The 33 miles from Kaslo to Cody Creek is built with a view to the heavy traffic in ore from the mines of the Slocan. The connection between the Slocan mining country in British Columbia and the Great Northern road will be carried from the mining region, starting from Sandon and proceeding to Kaslo on Kootenay lake, and thence by lake and river to Bonner's Ferry, which is on the main line of the Great Northern.

—Considerable present attention is given to a new invention of interest to weavers and cloth manufacturers. The Hunt Loom and Fabric Co. is a new local corporation, organized to handle a newly patented attachment, which, it is claimed, will do away with the pickerstick, hobbin and shuttle now in use in every weaver's loom all over the world. Machinists and weavers who have examined it say it doubles the loom's efficiency, while only requiring one-quarter the present required power, thus greatly reducing the cost of manufacture.

—California and San Francisco are awakening to the menace of competition from Japan's pauper labor. Already several kinds of manufactured goods are being imported into this city from Japan, laid down at prices with which under our system of comparatively high-priced labor, California cannot compete. It is the natural outcome of the free-trade doctrine; protection to home industries is the only remedy. If the product of Japanese labor at five cents a day is admitted duty free to the United States it means five cents a day to the laborer here, the same as there. There is no "political doctrine" about this. It is the cold, hard fact.

—Recently the Collector of Customs of this port submitted to the Treasury Department an application from the Alaska Improvement Company for drawback on imported tin entering with domestic lead into solder used in the manufacture of tin cans exported with salmon. Acting Secretary Hamlin replied that as it appeared the quantity of tin contained in the solder so used could be ascertained by an examination of the finished cans the Collector was authorized to allow on the exportation of the cans a drawback equal in amount to the duty paid on the pig tin used in soldering the same, less the legal deduction of 1 per cent. The quantity of the imported pig tin so used might be determined by allowing 1 pound thereof for each 104 cans exported.

—It is stated in Lima, Peru, that in view of the active competition between the representatives of British, French and German companies desirous of undertaking the work of building a new railroad between Lima and Pisco, representatives of American companies should not lose the opportunity of competing for the work. There is already a road connecting that city with Pisco, which is a maritime town 130 miles south-southeast of Lima, near the mouth of the Pisco river, opening into the Pacific, but it is not of a satisfactory nature, and it is proposed to build a new road over a better tract of country at the earliest possible date and on the best terms possible for Peru. There is no doubt that the authorities and the people at large would prefer to see the road built by Americans in preference to the British, French, or German companies, which are desirous of taking the contract. Display of enterprise on the part of Americans there and elsewhere in South America is looked upon with satisfaction, and is much better received than similar advances upon the part of other nations.

Scientific Progress.

The Uses of Coal Tar.

The variety of useful products obtained in the laboratory from coal tar is noticeable. This substance, formerly thrown away as worthless, serves the purpose of the synthetic chemist admirably, inasmuch as it is a very elaborate compound, very cheap and containing a great variety of elements. It has furnished hundreds of new and valuable medicines, particularly antifever remedies. From it are obtained the aniline dyes, which give all the colors of the rainbow. Aniline itself is colorless, its salts having the brilliant hues. From coal tar also saccharine and dulcine have been obtained. Each of them is more than 200 times as sweet as sugar, the latter being more pleasant to the taste.

Formerly no dye material exceeded madder in commercial importance. It was the basis of nearly all dyes, and the root from which it was obtained was grown on a great scale in Europe and Asia. But alizarin obtained from coal tar has destroyed this agricultural industry by driving the plant out of the market. Alizarin is the coloring principle of madder. From coal tar also comes purpurine, which nowadays forms the basis of many dyes. Some time ago Baeyer, a German chemist, manufactured indigo as pure as that yielded by the plant. Commercially speaking the artificial indigo has not been a success, because other dyes made in the laboratory do the same work more cheaply. Everybody knows that the "artificial camphor" sold in the shape of "moth balls" is got from coal tar.

THE modern idea of fireproof construction is not all that is claimed for it, according to the opinion of the chief engineer of New York City's fire department. The objections raised by him are shown in the following extract. He says: Buildings of brick and yellow pine are more easily handled in case of fire, and their contents have more chance of being saved than those of the modern structural steel fireproof blocks. When subjected to intense heat the steel warps, causing destruction as certainly as if the flames consumed the material. As even in the best-constructed buildings there is ordinarily a large amount of material that is combustible, and as the massing of buildings in the great cities is certain under present conditions to lead to the juxtaposition of buildings of dubious safety, it is almost inevitable that a great fire will destroy some superior edifices. A building may be ever so well constructed, but if it is subjected to the intense beat of half a dozen fiercely burning neighbors, it is almost as surely doomed as if it were made of shavings. In such a case the steel beams and the ironwork might be positive instruments of danger, as their warping would bring destruction. It is to be suspected that the science of safe building is not yet mastered; certainly the practice is not.

A PROCESS has been patented in Germany under which the muscular coating of the intestines of animals is divested of both the interior and exterior layers of mucous membrane, and then digested in a pepsin solution until the muscular fibers are half digested. Then it is treated with tannin and gallic acid. The result is a tissue which can take the place of the natural skin, and which, when laid on the wound, is entirely absorbed during the healing process.

EXPERIMENTS in welding metallic bodies by simple pressure at heats below their fusing points, made by the Royal Society of Belgium, show that the most perfect joints are obtained with gold, lead and tin, and the worst with bismuth and antimony. Cylinders of extremely pure metal with smooth surfaces were brought together by a handscrew and kept at a constant temperature between 200° and 400° for from three to twelve hours. When separated the break did not coincide with the joined surfaces. Platinum was softened and welded at a temperature of 1600° below its point of fusion.

GEOLOGICAL SPECIMENS brought home recently from the Antarctic region by a Norwegian explorer have been analyzed and found to contain microlene granite, with garnets and tourmaline and mica schists. As these have never been seen in an ocean island, the conclusion is that a continent exists around the south pole.

A PETROLEUM tank steamer recently launched in England is so arranged as to carry oil cargoes to Asiatic ports and bring back general cargoes. This has been rendered possible, by means of elaborate arrangements made for purifying and ventilating the oil tanks after discharging their liquid cargo.

Electrical Progress.

San Jose's Electric Railway.

Fifty miles from San Francisco is one of the prettiest cities of the State—San Jose—in which the first successful electric railway on the coast began operations, eight years ago. In few places in the United States has electricity been more largely utilized than in that pleasant municipality. No finer roadway is found anywhere than the famous "Alameda," 150 feet wide, three miles long, on which the electric cars speed to Santa Clara. The avenue on which the double track runs is lined throughout its entire length with beautiful homes, handsome grounds still in fullest foliage in bright November sunshine, as depicted in the accompanying engraving. The town of Santa Clara, to which the road extends, is noted as being the site of the first white settlement in the county.

SAN JOSE AND SANTA CLARA ELECTRIC RAILWAY.

Electricity at Paris in 1900.

Paris, France, will celebrate the last year of this century by a World's Fair, at which it is intended to make an electrical display that will fittingly illustrate electrical progress and form eloquent contrast with similar displays in '67, '78 and '89. The power required for lighting will be 12,000-horse power, as compared with 1500-horse power in '89. The power required to show the exhibited machinery and apparatus in motion amounted to 350-horse power in '55, 635-horse power in '67, 2500-horse power in '78, 5500-horse power in '89, and is estimated at 8000-horse power in 1900. The efficiency of the power distribution in Chicago, where a 500-volt continuous current was used, was 73.37 per cent; at Lyons, in '94, where continuous and alternating current was used, it was 73.38 per cent. Assuming 70 per cent total efficiency, the required steam power is stated as 28,500-horse power, reduced to 20,000-horse power by the following schedule:

	Horse Power.
Furnish during the day to motors	11,400
Furnish from 7 P. M. to midnight to one-fourth of the motors	2,000 H. P.
Furnish for light	17,100 H. P. 20,000

In addition a water-power transmission is proposed of 2100-horse power for the dam at Suresness, a distance of somewhat over six miles from the grounds. The assumed efficiencies of 0.75 for the turbines, 0.80 for connection of turbine and generator, 0.90 for the generator and 0.90 for the line, deliver 1170-horse power at the grounds and result in a total efficiency of 0.49.

ELECTROLYSIS—which from the present standpoint can be termed galvanic action—truly exists as such, according to the author of a recent paper, and in large ocean-going vessels causes much trouble. There, tons of zinc are used to offset this action, due partly to using too pure a water on account of the hot-well system, and incited further by the salt water used. It is known that zinc is one of the most positive metals known in galvanic battery work, being more positive than iron. The zinc put into the boiler assumes the position of the positive pole, consequently it is destroyed in place of the iron by the battery solution in the steam boiler. Its reaction and conversion into its oxide is similar to that of the iron, it being destroyed under the same influences.

IT was only a little electric motor, shoved away in a dark corner where the dust could settle down and be undisturbed from New Year's till Christmas — an overworked, dirty little motor—a motor that finally, in fiery language, objected to the ever-increasing load. But the master simply screwed down the brushes more tightly and added an additional burden. Then the little motor concluded that it was time to teach somebody a lesson, and the total cost of that lesson is now estimated by the insurance officials at $65,000. The new motor installed in the new factory will enjoy living in a small, dust-proof apartment, will be regularly and thoroughly cleaned, and probably will never be overworked.—Electrical Engineering.

LONG-DISTANCE TELEPHONES are making some giant strides nowadays, and it will not be long before they will entirely supersede the telegraph. Between New York, Boston and Philadelphia there are now about forty long-distance wires, and in the whole system there are 55,000 miles of pole line and 265,000 miles of wire, and the system is growing fast every day.—Electric Review.

Mechanical Progress.

A Hydraulic Power Plant.

The hydraulic basin from which water is now taken by the Niagara Falls Power and Manufacturing Company for furnishing power to the various mills supplied with power by this company is located parallel to and about 300 feet back from the edge of the high bank of the Niagara river. For this new plant the water will be taken in an open canal from this hydraulic basin to a forebay 30 feet wide and 22 feet deep, which is now being built near to the edge of the high bank. From this forebay penstock pipes built of flange steel, eight feet in diameter, conduct the water down over the high bank 210 feet to the site of the power house on the sloping bank at the edge of the water in the river below the falls.

The site for the power house is now being cleared; broken and disintegrated rock mixed with huge boulders which have fallen over the bank in past ages covered the site in places to a depth of 75 feet. The work of clearing this material from the site of the power house, which is now nearing completion, has been largely done by means of a giant, the process being almost precisely similar to that employed in hydraulicking in this State. The monitor in use at this point is the first one used in the East. Below this debris is a stratum of Medina sandstone, on which the power house will stand.

The building will be 60x100 feet, the intention being to add to the length of the building (60 feet) and place other wheels, fed by separate penstocks, from the same forebay as above, as demand arises. There are four turbine wheels of the horizontal type, furnishing about 8000 horse-power, to be located in the first floor of the power house. These wheels will work under a head of 210 feet, the highest head under which water has ever been used for power in the quantity proposed in this plant. The pressures exerted by water under this head are enormous, and every detail of the penstock and water wheels must be designed with the greatest care to hold it.

The penstock leads from the forebay vertically about 135 feet to the top of the sloping bank, thence down the slope to the side of the station next to the bank, making the total length of the 8-foot pipe about 240 feet. Into the building the pipe, 10 feet in diameter, runs horizontally, suspended over the tail race. The thickness of the steel is fifteen-sixtcenths of an inch. All horizontal joints are butt-strapped, held with three rows of rivets on each side. The cross seams are all double riveted. The necessity for strong work in this pipe will be seen when it is remembered that the total pressure on the end of the pipe exceeds a million pounds. From this horizontal portion of the penstock the water is taken directly up through 60-inch valves on to the water wheels, which are supported upon iron beams stiffened by braces into the side of the tail race.

The wheels are fitted in cases 11 feet in diameter, made of the best heavy plate steel, double riveted. The feeder pipe connection to these large cases are on the bottom, riveted directly to the 5-foot hydraulic cylinder valves. All these valves are connected to the main feeder pipe, which is 10 feet in diameter, and occupy the space under the turbines between the foundation walls. The draft tubes from the turbines pass down each side of the main feeder pipe, connecting with the tail water, which is set at a distance of 27 feet from the center of the turbine shaft.

A New Metal.

Glucinium is the name of a new metal which seems to be destined to become of great importance in the very near future. On account of its peculiar qualities it will be used especially for electrical purposes. As its atomic weight is 9.1, and its specific gravity 2.00, its tractive power is considerably greater than that of iron and its conductibility is equal to that of silver. Glucinium, therefore, is more capable of resistance than iron and a better conductor than copper, and in addition to all that, it is lighter than aluminum. If these claims for this new metal should be confirmed by practical use, there is no doubt that glucinium will be used extensively for electrical purposes, the more so as its commercial value will amount to about $20 a pound, or 160 times less than the same volume and ten times less than the same weight of platinum.—American Manufacturer.

Hardening Steel by Gas.

The Germans are interested in a new process for hardening steel by means of gas. The invention originated with the French steel and iron firm Schneider & Co., of Creuzot. It is a well known fact that gas, under great heat, deposits carbon in solid from. Upon this depends its light effects, and also the formation of the so-called retort graphites, a thick covering of pure carbon on the walls of the gaslight retorts. The gas that strikes the retort walls deposits part of its carbon upon them. This is the fact upon which Schneider bases his invention for cementing together (uniting) steel armor plates. This hardening is obtainable by the application of carbon. Formerly, the process of hardening consisted in covering the plates with layers of coal and heating them till they glowed. Schneider's process puts two plates into a furnace, one on top of the other, with a space between. This space is made gas tight by means of asbestos packing around the edges, and the plates are heated red hot, while a stream of gas is poured into the space indicated. The carbon thrown out by the gas is greedly taken up by the glowing plates until they are thickly covered. The depth of this carbon covering can be regulated by the amount of gas admitted. In order to secure regular and uniform action during the process, and to prevent the pipes that carry the gas to the space from absorbing any carbon, they are insulated in other pipes through which water is constantly circulating. It is believed that this rapid carbonizing process will be applicable to many other branches of the steel industry.

Practical Information.

Splicing Belt Lacings.

A good many ways of splicing belts are described in technical papers, but very little has been said about splicing belt lacings. Usually the workman will tie a knot in two pieces of lace rather than draw the knot snugly up to one side of the belt, and proceed to put in the splices. Sometimes he uses up one piece, then sews in the other piece, tucking both ends underneath. This works pretty well until the lacing begins to start a little; then the ends come out, and the first thing he knows the whole lacing is coming apart. Don't tie a square knot and don't tuck in the ends. Just cut a hole in the end of each piece of lacing; make the hole a distance from the end equal to half the distance of the lacing; put one piece of lacing through the hole in the other piece; then draw that piece through the hole in the first strip; pull this connection down as small as possible, and it will be found to take the shape of a double square knot, making a very smooth and firm splice. It cannot be untied and it does not wear out easily. Such a splice usually lasts as long as the rest of the lacing.

Eggs are now imported to London from Russia, shelled and preserved in hermetically sealed tins, from which they are drawn off through a tap. Eggs in this condition are principally used by pastry cooks, and the advantages claimed for the system are freedom from danger in transport and long keeping qualities. The tin or drum is packed with straw in a wooden case, and holds the contents of 1000 to 1500 eggs, the white and yolk being mixed together, poured into the drum, and the aperture closed with a bung and sealed. Great care is said to be necessary in selecting the eggs to be preserved, as one bad one will spoil the whole cask or drum.

Only one person in fifteen has both eyes in good condition, and in seven cases out of ten one eye, generally the right, is stronger than the other. It is found that just as people are right or left-handed, so they are right or left-sighted, and while apparently looking with both eyes, they often really use only one. Out of twenty persons whose eyes were tested by a German doctor, two only were found to be left-sighted. The reason of the greater strength generally possessed by the right eye is not altogether understood, but probably the natural tendency to the greater use of the right side of the body has something to do with it. In using weapons, for instance, mankind has been taught for ages to assume attitudes in which the right hand and side have most exercise, and this discipline has undoubtedly had its effect on the eye. Old sea captains, after long use of the telescope, find their right eye much stronger than the left—the direct effect of exercise. This law is confirmed by the experience of artists. If a person who has ears of equal hearing power has cause to use one ear more than the other for a long period, the ear brought into requisition is found to be strengthened, and the ear not in use loses its hearing in a corresponding degree.

A complete and immediate revolution of transportation methods, involving a reduction of freight charges on grain from the West to New York of from 50 to 60 per cent, is now predicted. The plan proposes using light and inexpensive corrugated iron cylinders, hung on a slight rail supported on poles from a cross-arm—the whole system involving an expense of not more than $1500 a mile for construction. The rolling stock is equally simple and comparatively inexpensive. Continuous lines of cylinders, moving with no interval to speak of, would carry more grain in a day than a quadruple-track railway. This would constitute a sort of grain pipe line. There is also prophesied the probable abolition of street cars before the coming horseless carriage, which can be operated by a boy on asphalt pavements at a total expense from labor, oil and interest of not more than one dollar a day.

A safety lamp for mines, operating upon a peculiar principle, is being used in Germany. The lamp is not closed in any special way, like other lamps. It matters very little whether or not the workman, disregarding the regulations of the mine, succeeds in opening the lamp, for there is a special arrangement by means of which the flame is extinguished at the same instant. In the interior of the lamp glass is a spring, which is compressed when the upper piece is screwed down, and which enables a cap to operate upon the wick in such a manner as to shift it aside, facilitating the lighting of the lamp, and afterward the combustion. When the spring is worked in the contrary direction, the cap again operates upon the wick, and the flame ceases the moment the cap comes in contact with the air. The lamp can be lighted without being opened. Oil, benzine or petroleum can be used as fuel.

This College Instructe in shorthand, typewriting, bookkeeping, telegraphy, penmanship, drawing, all the English branches, and everything pertaining to business, for full six months. We have a large corps of teachere and give individual instruction to all our pupils.
A Department of Electrical Engineering
Has been established under thoroughly qualified instructors. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

A Free Milling Gold Property for Sale.
The Mammon mines, with milling records that settle the question of doubt, fully developed for a successful enterprise, with all machinery, mill, buildings new, immense water supply, maps and mining engineers' report, clear title, and fully explained why these mines are sold. The investment positively safe and the chance of a lifetime for a small capital to acquire a fortune. Correspondence solicited that means business forthwith.

Personal.

HENRY BURNS is superintendent of the Canyon Creek mine, Trinity county.

C. M. SHAW is the new superintendent of the Black Hornet mine, Boise, Idaho.

M. AUBREY of San Diego has taken charge of the Shenandoah mine at Mesa Grande.

RICHARD WHITE has been appointed foreman of the North Banner mine, near Grass Valley.

B. F. LAEY, of the Park & Lacy Co., has returned from Australia, where he has been sojourning since last April.

C. A. COFFIN, president of the General Electric Co., is credited with intention to resign on the 31st of next month.

THOMAS B. EVERETT, now of Denver, one of the organizers of the Colorado Mining Association, is revisiting Placer county.

R. PAYNE, recently from London, has the superintendency of the Alaska mine, Sierra county, under the new management.

D. D. STEWART, formerly foreman of the Mexican mine, is prospecting some quartz properties in the Berner's Bay, Alaska, district.

CHIEF ENGINEER H. R. LEACH of the Boston has been relieved by a medical board at Mare Island. Another chief engineer will be assigned to the ship.

W. PELLEW-HARVEY is about to deliver a course of lectures in Vancouver, B. C., on the detection of mineral in ores, chemistry, metallurgy and practical assaying.

ALEX SIEMENS is surveying the route for the new cable to be laid up the Amazon from Para to Manaos under concessions from Brazil. The length is 1365 nautical miles.

C. F. LAPE has been appointed superintendent of machinery and car departments of the Southern California, vice G. W. Prescott, resigned, with headquarters at San Bernardino.

BARTON SEWELL of Chicago has been appointed general manager of the United Smelting and Refining Co., which has a smelter at Helena, one at Great Falls, Mont., and a refinery at Chicago.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 19, 1895.

550,120.—RAILWAY—A. Bannister, S. F.
550,037.—PROPELLING VESSELS—J. Bond, Turlock, Cal.
550,038.—CHILIAN MILL—M. P. Boss, S. F.
550,016.—VOTING MACHINE—C. Christensen, Oakland, Cal.
550,067.—VEHICLE BRAKE—J. Christensen, S. F.
550,172.—KEYBOARD—R. Hensley, Salem, Or.
550,175.—LADDER SPLICE—L. G. Holden, Portland, Or.
550,176.—SOLDERING MACHINE—M. Jensen, Astoria, Or.
550,021.—MILK CAN COVER—Jenny Laplace, S. F.
550,036.—DIE—T. O'Leary, S. F.
550,061.—AXLE GAUGE—R. A. Simpson, Ferndale, Cal.
550,141.—PUMP—Smith & Worner, Fairhaven, Wash.
550,207.—BRACKET—H. G. Traeger, Porterville, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY CONSTRUCTION.—Joseph Clark, San Francisco, Cal. No. 549,704. Dated Nov. 12, 1895. The object of this invention is to provide rails and wheels so formed that when run on a level or without any appreciable grade the smooth-faced portion or tread of the wheel will travel upon a corresponding smooth-faced rail, and when inclines or grades are to be overcome a toothed portion of the same wheel will engage with a correspondingly toothed portion of rails laid upon the grade so that the tractile power will be correspondingly increased and slippage of the wheels will he prevented. The invention consists in the combination of wheels having a tread adapted to run upon the face of an ordinary rail flange of larger diameter projecting upon the inside thereof; a gear projecting from the outer side of the wheels, having a diameter smaller than that of the tread portion, with rails having a face upon which the smooth tread of the wheel is adapted to travel and a toothed portion projecting upwardly adapted to he engaged hy the teeth of the wheel when the latter is traveling upon the incline. The right portion of the rails is so constructed as to automatically discharge dirt and foreign suhstances which may fall therein.

DESIGN FOR LAMP CHIMNEY.—Herbert Sanford Malthy of Santa Cruz, Cal. No. 24,858. Dated Nov. 5, 1895. The desigu of this invention consists in a lamp chimney of conventional form having a circumferential flange projecting from its lower straight portion and hroken at intervals to leave intervening spaces, said flange haviug an essentially triangular or V shape in cross section, its upper side being suhstantially horizontal.

PROPULSION OF VESSELS.—John Bond, Turlock, Cal. No. 550,037. Dated Nov. 19, 1895. This invention relates to improvements in the propulsion of vessels. It consists essentially of a chamher formed heneath the hottom and central portion of the vessel and adapted to contain the engines or motor. At each end are eylinders having plungers reciprocating therein and driven by plunger rods which extend through stuffing hoxes into the central chamher, where they connect with the engines. These plungers draw the water in when they recede, and force it out with considerable energy on account of the rapid movement of the piston. But one of the engines is operated at once, the one at the rear heing employed to propel the vessel forward, and the one at the front may he used when it is desired to move the vessel astern.

RAILROAD RAIL.—Alfred Bannister, San Francisco, Cal. No. 550,120. Dated Nov. 19, 1895. This invention consists of a solid steel rail, the upper part heing in eross section, essentially the form of an equiangular trapezoid, having extensions or flanges upon each side forming a solid hase with a width approximately douhle the depth of the rail from top to hottom. In conjunction with this is a wheel having a flange or flanges, the angle of which is slightly greater than that of the side or sides of the rail. The wheel may have either a single flange, like the ordinary railway wheel, or it may have one upon each side which serves to prevent the side oscillation of high rates of speed. The rails are preferahly laid upon continuous longitudinal stringers which are imbedded in the road-bed and are also supported hy suitahly disposed eross ties, adding greatly to the strength of the road-bed. This invention may he an important one. It is of such shape as gives to the metal its greatest possihle strength to resist injury from compression from top or side. It overcomes the pressure of the wheel flange on the inside and top of rail, aud, hy carrying its load always on the center, and never on the side of its tread, removes all leverage to draw spikes out of and force rail base into the stringers. Its great strength is in its hase, whose width is douhle the perpendicular height, so that no tendency to he forced over on to its side hy the pressure of the wheel flange exists and all top-heaviuess is also thus removed. Its great safety against "rail spreading" or upsetting is apparent; and having overeome the pressure of the wheel flange, it makes the longitudinal stringer perfectly safe, and thus, with its six-inch-wide hase, multiplies the rail area resting on the stringers by nearly five and adds to the strength of the road-hed to a still greater extent. The cost does not exceed that of the old rail, while the wear and tear and locomotive power required are much reduced. In short, it infallihly fills all requisite essentials to secure the beam or multiple for height strength, as: 1. The load is uniformly distrihuted across its tread. 2. Its perpendicularity is perfect. 3. The rigidity of its sides is assured. This is not the case with the old rail on much of our present railroads, especially on curves.

The Boom Gold Mines.

These mines, fully developed, giving high grade, free milling gold, with all the machinery, mill, buildings, water, must now be sold for a song, to raise money for private purposes. Maps, reports of engineers at command; title clear; no misrepresentation. Investment positively safe. Everything new and complete. Correspondence desired that means strictly business. A splendid chance for a small investment.

DEWEY & CO'S
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.
Advice and Circulars free.

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

SACRAMENTO, CAL.

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 28, 1895.

But little could he said this week that was not a repetition of last week's remarks.

The railroad men are acting, according to the Chicago *Railway Review*, like our stock investors. It says: "The question agitating large buying interests in iron and steel is, How soon will prices reach the lower level to which they are drifting? Another question is, What will that level he? Ore has taken a stand at a point which large buyers refuse to contract. Steel buyers who must renew their contracts in Decemher are hoping that the bottom prices will he reached hy that time. The knowledge that large requiremcnts await filling and that manufacturers are anxious to cover the needs of 1896 as soon as possihle, gives the whole market an undertone of strength. Just now all markets are quiet, and hoth sides await developments."

A Pittshurg dispatch says an advance of 2 per cent in wages for steel and sheet-iron workers of all amalgamated mills in the country has heen granted by the manufacturers. It will affect about 12,000 workers.

New York Metal Market.

NEW YORK, Nov. 28.–PIG IRON—Southern, 12@13.00; Northern, 12@14.00.

COPPER — Brokers', 11c; exchange, 11.20c.

Mining Share Market.

SAN FRANCISCO, Nov. 28, 1895.

In years gone hy, when the late Senator Fair was credited with the manipulation and Occidental — commonly called "Ox" —was brought to the front as the leader, it was considered the forerunner of more activity in the share market. Who has heen instrumental in the hringing of Occidental to the front this week is not known, and no one seems to care so long as there is more activity. The advance in the shares of this mine to over 400 per cent within a few days, with quick turns in the up-move, has brought about an improved tone and a more huoyant feeling throughout the list. Trading, so far, appears to he confined largely to chronic dealers, who are encouraged hy cross-orders and other well-known methods pursued hy manipulators to hring about higher prices. Those in position to form opinions worthy of consideration do not encourage the helief to hope for a continuance on the up-grade longer than one or more weeks, hut even this is, if it does not collapse sooner, cause for congratulation. They think that the development made in Occidental does not justify good prices as a husiness proposition, unless a further improvement continues; hut, as a gamhle, of course they are not in position to pass judgment. Probahly this opinion is grounded largely on past experience and not on what might take place with money-eyed backing to the proposition. As yet, nothing has appeared in the manipulation to warrant asserting that it is more than what has heen witnessed in the market for several years past. It looks very much as if Occidental is heing used as was Confidence a short time ago, which, after selling a line of shares and making shorts fill, was hroke back and the entire list sent down to low prices again. If this should prove true in the present, then the hulls will be as hadly hurt as the hears are heing squeezed now.

News from the Comstock mines is essentially unchanged, although as work progresses in several there are more encouraging features in one or two mines in each group. That this encouragement seems to he genuine, is witnessed in the activity given the past week to the Occidental shares. As this mine is situated on the Brunswick lode, the manipulators can make it a leader so as to attract attention from the Comstock mines, and when the object is accomplished, drive it down, carrying the entire list to much lower prices. The work heing done in the Alta group is quite important, particularly in Alta, where it is in the direction calculated to develop more high-grade ore of larger size. In the Gold Hill group there is said to be work under way, which is reported in such a way as not to attract the cupidity of the puhlic. Probahly this is a correct way, and doubtless is, from the fact that outside traders in shares rush in as huyers on the least favorahle showing, only to he swamped hy a break when the showing does not materialize into anything which justifies moneyed men to work it up, thus exemplifying the old saying that fools rush in where angels fear to tread. The work in this group is largely towards the west. In the middle group they continue to follow up streaks and small veins in the hope of their leading up to something of importance. In doing this they extract some ore. The work in this group is towards striking the west lode. The long west drifts in Bullion and Gould & Curry are heing pushed as fast as can he under the many disadvantages which are natural to look for under this kind of work. In Con. Virginia the work is to develop the 1000-foot level and also to get the levels at around the water levels into hetter condition. They may find it necessary later on to pump this mine out, as for that, the entire lode out for working helow the Comstock tunnel level. In Ophir and Mexican the upper levels are given attentiou, hut at the same time the work around the 1465-foot level is not neglected, yet much time will have to he consumed before results can he known. In Union and Sierra Nevada the work is heing slowly watched, with the hope that mining mens' expectation will he realized in striking something more than assessments.

The Brunswick lode is attracting renewed attention owing to favorahle reports from Occidental. The strike in the latter, which is quite important, is not sufficiently developed to justify uudue excitement in the shares; although the present showing is enough to warrant a gamhle, hut not an investment, for any day they are liable to run out of ore. It will take time to show what it is worth. Too many good showings on the Comstock lode have heen made which did not materialize to tempt moneyed mining men to huying shares for holding, hut these showings were sufficient to euable a few outside men to make a false move on the up grade, only to he followed hy a collapse, with dire results to others who hought in expectation of a large development and big deal. The other mines on the Brunswick lode are pushing exploiting work, with the hopes of finding ore of some importance. This lode will hear watching, hut for how long is, as yet, an open question.

From the outside mines there is nothing coming to hand to excite attention, although in the Bodie district the groundwork is heing laid for more extensive working in 1896; yet there can he no question that it will have to he extended to lower levels to develop anything more than assessments. Time will he required for the purpose of working lower.

Taking the situation on the different lodes as a whole, there is much encouragement to look forward to for good things in the future, hut at present it does not warrant venturing in on a legitimate investment proposition. No one can tell what will he revealed by work, even one day in advance.

The following illustrates the changes of the week:

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 8 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

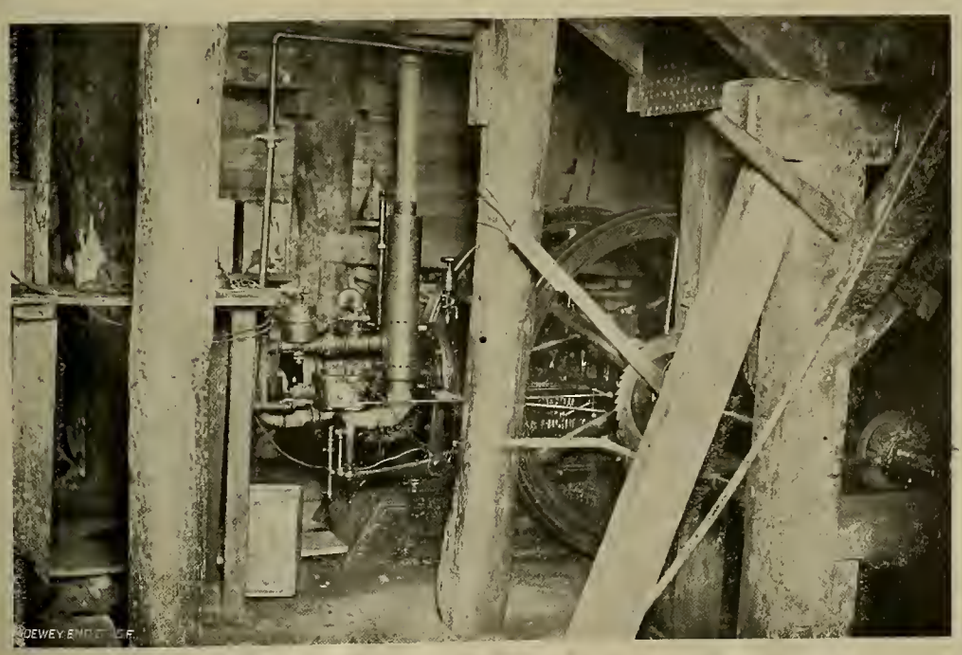
Gasoline Engines in Mines.

This motive power has done much in developing many properties that otherwise would have remained non-paying investments; investigation shows that the gasoline engine has met with favor among mining men wherever used. A representative of this journal lately visited the Pioneer gravel mine at Grass Flat, Sierra county, where they have been using an engine of this description since April, 1893, when they put in the first plant, consisting of a 12 H. P. Union gas engine and hoist, manufactured by the Union Gas Engine Company of San Francisco. This engine also drives a Jackhead pump for pumping from sump. This plant is located in the mine a distance of 1400 feet from mouth of tunnel, and at head of incline; the incline is 150 feet long, with a fall of one foot in four.

Reference to the upper cut will show top of incline, also double drum hoist and frame. As will be seen, the track on incline is double and the hoist is so arranged that one loaded car is hoisted and one empty car lowered at the same time. The cars carry about 3500 pounds of gravel, and are raised at a speed of 150 feet per minute. About 350 carloads are raised every twenty-four hours. The lower cut shows engine to right of tunnel (going in) setting in such position as to have drums of hoist, to which it is directly connected, come in line with the double track. The exhaust of engine is carried into the air shaft and is piped directly to surface, a vertical distance of 230 feet. This prevents any fumes being returned to mine to vitiate the air, and a person going through the mine would never suspect that there was any motive power used, until he came upon it, for it runs noiselessly and gives out no odor, there being nothing to indicate its presence until it meets the view. The pump used in connection with this engine has a 6000-gallon capacity per hour, and is driven from a countershaft at the head of the incline. This pump met all requirements until last winter, when it was found that the mine was making so much water that the pump could not take care of it. An order was immediately sent to the same company for another plant, consisting of an 8 H. P. engine and a No. 3 centrifugal pump with a capacity of 21,000 gallons per hour. This plant is situated midway of incline, to left of same going down. The pump is placed a few feet above sump, and the discharge pipe runs over top of incline and into flume in tunnel. At one time it was found necessary to run this plant for twenty-one consecutive days, and the mine men say during that time the engine never faltered.

HEAD OF INCLINE PIONEER GRAVEL MINE.



The company recently ordered another engine of 15 H. P., to be used for hoisting in the new tunnel now under construction. Mr. Deisem, superintendent of the mine, in speaking of the engines, says that he is satisfied with the motive power for underground work.

The Sterling Mining and Milling Company are mining in Nye county, Nevada, where wood and water are entirely out of the question, consequently they concluded to try the gasoline engine. They purchased from the Union Gas Engine Company one 25 H. P. engine, and used it to run a rotary mill at one of their mines. After testing it for sufficient time to ascertain to their satisfaction the practicability of this form of motive power, they gave an order for three engines of 50, 25 and 50 H. P. respectively.

The Pacific Coast Borax Company have had one of these engines in operation since February, 1891. This engine has been in constant use since that date. It is used for hoisting at the mine in Death valley. Previous to the installation of this engine the company was obliged to do their hoisting by mule power, and owing to the scarcity of water in that section the water for the mule power had to be hauled a distance of forty miles. A gasoline hoisting plant was supplied with a small tank of water, which was used for cooling the cylinder. This was circulated or used over and over, and the only loss was from evaporation, which was made up by the addition of a few gallons each week. This engine was so satisfactory that the Borax Company gave an order for another hoisting plant in August, this year.

The Keystone Mining Company at Keystone, Nevada, also have a hoisting plant of 12 H. P., which has been in operation for the past three years. The books of the Union Gas Engine Company show that there has only been an expenditure of $2 for repairs on their engine since it was started.

On page 373 of this issue will be found an engraving of the 8 H. P. engine referred to in position in the Pioneer gravel mine, Sierra Co.

Coast Industrial Notes; Personal; A Question Answered, 375. Notices of Recent Patents, 383.

CONGRESS convened last Monday. Report is made that a bill will be immediately introduced suspending, indefinitely, the statute requiring annual assessment work on unpatented claims. This is hardly credible: it would be a mistake and an injustice not possible of consummation to have such a measure apply to '95 and an injury to the best interests of the mining world to attempt such legislation for '96. The suspension of assessments in '93 and '94 did not do any material good and a repetition of such enactment would be unwise. In general, the holder or holders of a claim should either work it or let go, and the present law is lenient enough without any abrogation of its exceedingly light requirements.

COMMENTING on the tables of gold yield of the State by counties, as published herein on the 23rd ult., the Nevada *Transcript*, speaking for Nevada county, says that if the gold producers of that county complied with official requests and reported the yield, the aggregate credited to that county would be more, which is believed to be true. Regarding Tuolumne county, the *Banner* says: "The falling off in Tuolumne from the figures of 1892 is undoubtedly due to a large extent to the cessation of pocket mining, and the turning of the miners to the opening up and developing of permanent quartz leads which have only commenced to show their rich deposits since the beginning of 1895. This year's output will show Tuolumne far in the lead as a gold-producing county when the figures are footed up."

CONSIDERABLE now being published in the daily papers and elsewhere about big strikes and wonderful discoveries needs to be discounted. Hard times have sent many from other pursuits to the only present paying industry in California, and the season for deferred annual assessment work sends out many more. Considerable ground is being worked, and many promising developments made, but the wonderful stories in the morning columns are mostly exaggerations. Of such a nature is that one from Barstow, and the new camp thirty miles from there, where "the ore runs from $40 to $200:" "some of it is worth a dollar a pound:" "at the bottom of a 22-foot shaft a three-foot ledge averages $200." These are not intentional lies. Probably the correspondent believed what he sends; but such stuff hurts the region from which it emanates To any one who has ever been anywhere near Barstow the thing is ludicrous, but not more so than many similar statements from more promising localities.

Assessment Work.

The suspension of assessment work during the past two years, coupled with the statements published by the newspapers of the State of what constitutes assessment work, has so confused the miners that many of them are at a loss to know "where they are at." It is held that the law allows $5 a day for assessment work; that a ten-foot shaft, cut or drift is all that is required; that on placer ground only half the amount, or $50, in work is required on each claim of twenty acres; that if the miner's placer mine is but ten acres only one-half of the full amount need be done; that a claim can be held by "resuming work" on the 31st of December and continuing it on the 1st of January; that a company owning a number of claims, all adjoining, by working steadily on one of them before and after January 1st, can so hold the whole of them, even if the amount of work done on the 1st of January does not equal $100 on each claim. Now, these opinions are not gathered from the prospector alone, but are in good part those of leading mining operators. In this situation, the PRESS will do the average miner a great favor if at this time it will publish the full text of the law in relation to assessment work in California, on both gravel and quartz. I have discussed and had the subject "cussed" so often of late, and each time have agreed to refer the matter to you for final opinion, which please give through the PRESS and oblige the miners.

In answer to the above, received this week from Murphys, Calaveras Co., there is no provision in the Federal or California State law which allows any certain sum a day as a proper charge in estimating the value of the annual assessment work of one hundred dollars upon any mining claim. The rate of daily wages which are paid to miners at or in the vicinity of the claim upon which the work is done, is the proper basis for such computation: if the prevailing rate of wages is $2.50 a day, the equivalent of forty days labor should be performed; if the pay is $5 a day, then twenty days labor, by one man, would be in full compliance with the statute. Therefore, a ten-foot shaft, cut or drift would not be sufficient unless such work cost the claimant at least $10 a foot, or $100 in all. It makes no difference in this respect whether the claim is a lode or placer claim, or is full size or not: that is, if it does not happen to reach the maximum limit allowed by the law, for the same amount of assessment work—to wit, $100—must be done. It is, therefore, a mistake to suppose that if a placer claim contains only ten acres, whereas twenty acres are allowed to each locator, that $50 or anything less than $100 worth of work is sufficient to hold the claim. But this statement as to labor must be taken with this qualification, viz.: that all proper and necessary expenditures, such as necessary timbering and blacksmith charges, and the cost of powder, caps and fuse, and similar necessary expenditures, may be credited as part of the assessment work and proportionately reduce the number of days of labor or number of workmen employed.

If the locator, after the time for such expenditure has elapsed, but before third party's rights have intervened, resumes work and continues until the necessary amount is expended, his right is revived and relates back to the original location.

Consequently, a mining claim is not open to relocation on the first day of January succeeding the year in which the expenditures are required if work has been resumed by the proper party on the 31st day of the preceding December. But the work when resumed must be continued until the required amount is performed; otherwise the claim will become subject to relocation. To resume work on the 31st of December of the assessment year and to follow it up with several days work in the succeeding January, with say only one workman, or other inadequate expenditure, would not be sufficient to hold the claim against relocation after such suspension.

It is error to assume that a failure to file the affidavit of annual work under the California statute of 1891 works a forfeiture of the claimant's right and subjects the claim to relocation. That statute provides for nothing of the kind, and if it did do so it would be inoperative to that extent, because it would be in conflict with the paramount law—that is, the law of Congress upon the same subject. This latter law is silent as to how the fact of this performance of labor or improvements may be evidenced. The only advantage to be gained by filing this affidavit is that it affords *prima facie* evidence that the work has been done.

Briefly, then, if the required work has been done upon a mining claim it is not open to relocation, because an affidavit to that effect has not been filed with the proper County Recorder under the State law of 1891. The essential thing is the performance of the labor, not the making and filing of an affidavit that it has been done.

A company or individual holding a number of adjoining claims—that is, where contiguous locations are held as a joint claim—can do all the required annual assessment work upon any one of the locations to the aggregate amount of what the law would require on all the locations were they segregated, if it can be shown that each and all of those claims were benefited by such work done. That work or improvement must look to and have direct bearing on the development or working of the mine. The Federal Statutes state that such work may be performed by the original locators, their heirs, assigns or legal representatives. If the spirit of the Statutes on these matters is complied with, the interpretation is given construction most favorable to the miner; but evasion or delay may occasion him serious trouble.

A MINING "BOOM" is reported from Cripple Creek, Colorado's most promising gold locality, and the incorporation of new mining companies goes on at such a rate as to entail the employment of additional help in the office of the county clerk of El Paso Co. Cripple Creek is undoubtedly a good gold district. Some of the announcements by some of the Eastern financial journals are, however, slightly at variance with the truth. It is not the desire of the MINING AND SCIENTIFIC PRESS to spoil speculation if the New York or Chicago or Denver speculators are so minded; but since some of them see fit to attempt invidious comparisons between Colorado and California, and attempt undue laudation by misstatement, it is in order to state that one mine in one county in California—the Utica, Calaveras county—has been for some time producing more gold than all the mines in Cripple Creek district put together. "There are others."

OREGON mining papers agree that $2,000,000 will fairly represent that State's gold output for '95. The gold yield of any State is very difficult to correctly approximate, especially where, as in Oregon, there is no procurable data. Even in this State, with its admirable organization, mint statistics, express returns and commercial data, accuracy for such figures is not wholly to be secured. It is only by pledges that names or localities will not be divulged that most mine owners will give the returns from their properties, and too large a percentage of the blanks sent out are never filled up or returned. The pledges given are never violated, but it is only natural for individuals to hesitate giving the amount of gold yield. If the promised mining activity in Oregon comes to pass, that commonwealth will increase its gold yield in '96 fifty per cent over that of '95.

APART from any participation in the present discussion between the *Chronicle* and the *Examiner*, as to the relative or absolute circulation of those able journals, it is deemed worthy of note that twice in the past month the San Francisco News Co. has increased its order for the number of copies of the MINING AND SCIENTIFIC PRESS, weekly delivered to it, that concern having charge of the transient sales of this journal. This, in connection with the daily addition of so many new names to our subscription lists, goes far to justify the belief that, in addition to the fact that this is the oldest mining paper on the continent, it is the most widely read: so many of our old subscribers say in renewing that "it is the best," that without any attempt at self-praise, it is in order to quote the proverb that "what everybody says must be so."

CONSIDERABLE bonding of mining properties is going on. 'Tis a good thing, but can be overdone. Where the bonder means business and goes ahead developing the property the result is mutually beneficial; where the property is bonded in the hope of disposing of it to some one else before the bond expires the result is often unsatisfactory all round. Too many are willing to look upon a bond as a mere option, a "call" on the property for a certain time. The man who bonds should be able to show ability to develop, and failure to successfully establish such financial ability should debar him from the pernicious privilege of simply tying up a good property and spoiling its sale to some one else who means business. There is an element of risk in bonding mining property that must be reckoned. The remedy for

the abuse of the custom of bonding lies largely with the owner. If he insist upon due development and declines to entertain any proposition which leaves that out or in doubt, he will benefit himself and the district in which his claim is located.

A NOTICEABLE FEATURE of many of the new mining companies now being incorporated is the enormous figure of nominal capitalization—$1,000,000; $5,000,000; $10,000,000. Nothing is made and much lost by such fictitious and misleading starts. Montana has made a sensible law authorizing official incorporation fees proportionate to the amount of capital stock named, and it is noticeable that there the capital stock named in articles of incorporation is more in accordance with prospects and requirements. It is ridiculous to read, as one so often does, that "The Golden Lyre Co. has organized; capital stock, $5,000,000; amount subscribed, $100." It is not invariably the case that a new company is not justified in using seven figures in its stated capitalization, but when such a capital is named, its justification is usually found in the names of the subscribers and directors of the company.

THE argument so often used in communications to this journal against the California plan of assessing stock in a mining company is not confirmed by present Colorado experience, where, it is claimed, the progress of Leadville and other districts is impeded by the non-assessable plan of incorporation, even where the properties have been productive; they ceasing to be active when dividends ceased, there being no way to compel payment under penalty of having the stock sold. While objection may justly be made to the abuse of the principle, it is believed that the California custom of making mining stock assessable, and compelling the shareholder to either pay his assessment or lose his stock, is more conducive to the continued working of the mine—and the shareholder—than the Colorado plan as formerly practiced at Leadville.

THE London *Mining Journal* of the 2d inst. contains an illustrated account of the ceremony of cutting the first sod of the new shaft at Dolcoath tin mine in Cornwall, England, which took place on the 26th inst. The shaft is to be sunk perpendicularly for a depth of 500 fathoms. It will occupy four years in construction, and will cost £30,000. The reorganization of this company, and the beginning of work on a new basis, mark a change in Cornish mining methods, and the example of the Colcoath may be followed by other Cornish companies.

Concentrates.

NEVADA COUNTY blacksmiths are going to form a union.

EVERY hydraulic miner in southern Oregon is praying for a wet winter.

MERCUR, Utah, gold fields are to be prospected with diamond drills.

NEARLY 500 miners are at present working in the Mercur, Utah, district.

THE Maud Hydraulic Co., B. C., has sold its properties to C. F. Fishback of Seattle.

THE Sunrise mill at Kelsey, El Dorado Co., is finished and has begun operations.

ONE-THIRD of the workmen at the Bullion-Beck, Utah, mine have been discharged.

DENVER miners say Colorado's mining sensation of '96 will center in Summit county.

MINT SUPERINTENDENT DAGGETT'S Santa Rosalia mine shows a net monthly profit of $4500.

"WHAT is a wildcat mine?" is being discussed in Colorado's nine mining stock exchanges.

SUPT. NICHOLS says the capacity of the DeLamar, Nev., mill is to be increased to 150 tons per day.

THE Hunter and Morning mines in the Cœur d'Alenes, Idaho, have plenty of water again and are in full operation.

SILVER PEAK, Nevada, is overcoming its financial difficulty: one-half the company's debts were paid last week, and assurances given of final settlement.

WORK is to be resumed on the Pauper, one of the old-time bonanzas of War Eagle, near Silver City, Idaho. It was closed down just twenty years ago.

AUTHENTIC bullion shipment statistics are of value to the county or district sending them and benefit any region more than any other kind of mining news.

THE present rule of the London Mining Stock Exchange is that when application is made to quote a mine one-fourth of the total capital shall be represented in solid cash.

MR. SCHNABLE has taken charge of the Good Hope placer properties at Sawpit and Richmond Hill, Plumas county. A restraining dam has been completed in Onion Valley creek.

FROM everywhere come reports of new discoveries and "rich strikes," the great majority of which are the natural result of the great amount of assessment work now in progress.

PROSPECTORS are reported staking out claims on the Colville, Wash., Indian reservation. The reservation will doubtless soon be thrown open, but any present selections would be premature.

THE Mono Mining and Milling Co. has incorporated here. The articles of incorporation say the "capital stock is ten million dollars," though the amount subscribed may be slightly shy.

THE deferred action of the Executive Committee of the California Miners' Association has been further postponed, awaiting the action of the Southern Pacific Company, to which the matter was recently referred.

THE Witwatersrand, South Africa, gold output for October was 192,652 ounces, 2,112 ounces less than that of September and 10,921 ounces less than the August yield, but 19,274 ounces more than the output of October, '94.

THE California & Sonora Gold Mining Co. has incorporated; capital stock, $100,000—$51,000 subscribed; directors, J. C. Jens, A. Reed, T. Frolich, H. J. Cortsen, T. P. Meighan; object, to work gravel deposits in Sonora, Mexico.

THE Mineral Transportation and Mining Company incorporated in this city last Wednesday. J. T. Davis, H. M. Rutherford, W. H. Pettis, E. A. Armsby, H. W. Snow are directors: capital stock, $10,000,000; $6000 subscribed.

ACCORDING to the London *Economist*, the decline in the Kaffir gold market valuation from the first part of September to November 11th was from $1,076,863,120 to $717,994,125, a fall of $358,868,995, or about 33⅓ per cent in about sixty days.

STIMULATED by the example of Denver and Pueblo, Colo., Spokane, Wash., calls for the establishment of a mining stock exchange. Those exchanges are all right, when rightly managed, but, wrongly managed, they will hurt their locality.

SALES of mining stock at the regular sessions of the San Francisco Stock and Exchange Board for November were 352,675, making a total for the eleven months of '95 of 2,869,655 shares, against 3,722,065 shares during the same period last year.

IN the Argonaut-Kennedy case at Jackson, Amador Co., the former company has secured a restraining order from working in the disputed ground. Argument on the asked-for injunction will be made next Monday before Judge McKenna in this city.

LAST week the "Kimball-Magneto-Electro-Prospecting and Developing Co." incorporated in this city; capital stock, $500,000. The "Alaska Mining and Shipping Co., capital stock $5,000,000," also announces San Francisco as its principal place of business.

AT the Broken Hill Proprietary, Australia, during the week ending Nov. 21st, 6097 tons of ore were treated, yielding 483 tons of lead, containing 140,655 ounces silver; also 163 tons treated by amalgamating and leaching plants, producing 9932 ounces silver.

THE Calumet and Hecla Copper Mining Co. of Michigan will pay a dividend of $5 per share on the 18th, the fourth of like amount declared this year, and each of these amounts to $500,000, making a total of $44,450,000. The company recently increased its output to 9,000,000 pounds per month.

THE Dunsmuir *News* says the Iron Mountain Mining Company have guards stationed all over the hills to keep their men from going to the saloons, which are all outside of the dead-line; and if a workman crosses the line he is discharged, divested of his number and cannot come into camp.

A MANCHESTER, N. H., JOURNAL says the Whitney Sodium Co. has incorporated there: capital stock, $75,000: to manufacture "an oxide of sodium for amalgamating zinc and gold plates. It is easily adapted for use in both placer and quartz gold working and is to save a larger proportion of float gold than it is now possible to do."

THE Hale & Norcross case is still in court. Last week Secretary A. B. Thompson produced his books to show that the bullion received by the Nevada Mill & Mining Co. was worth $1,678,900, of which $718,344.12 was in gold and $960,576.64 was in silver. The loss by discount on silver was $250,834.16. The case comes up again next Monday.

IN the case of the United States vs. D. Ross and the Copper Queen Mining Co., begun five years ago, involving $183,000 claimed by the Government for timber alleged to have been cut on non-mineral land in Cochise Co., Arizona, the jury stood 9 to 3 and was discharged. The case comes up again in the Federal Court next February.

THE terms wet and dry ores are often confused. Generally speaking, a wet ore is one that has a high percentage of lead or copper, say 40 per cent and upward of lead and 20 per cent in copper; but ores that contain no lead or copper, or less than 5 per cent of either of these metals, are dry ores. Smelters do not pay for less than 5 per cent of lead, so if there is any line of demarcation it is at this point.

LAST WEDNESDAY the Supreme Court of the United States decided the case of B. Healy, involving the price of lands on alternate sections within railroad land grants, entered under the desert land laws. The court held that the laws providing a price of $2.50 per acre in such cases had not been repealed by the timber-culture act, as was claimed, and that $2.50 was, under the law, the correct charge on entries within land grants.

UTAH mining men have a particular interest in the admission of that territory to statehood, since the new constitution provides that mining properties and revenues shall be taxed. The properties are to be taxed at the price paid the Government for the surface ground. A source of greater revenue will be the tax upon the "net annual proceeds" of the mines, roughly estimated to aggregate two and a half millions at present.

CHRONICLING the sale of some recently acquired "agricultural" land, for a sum that indicates by its amount the fact that the tract is confessedly mineral, the Calaveras *Chronicle* suggestively says: "This sale, like that of the Peck Ranch, some two weeks ago, gives the prospectors another gentle reminder that, if they wish to sell a mine, simply locate a ranch, then swear there is no gold on it. Next thing following will be a sale."

FORTY-EIGHT mining companies incorporated in West Kootenay, B. C., since January 1, 1891, with a capitalization of $35,675,000. The largest are the Le Roi and Hall mines, limited, each with a capital of $2,500,000. There are four companies with a capital of $2,000,000 and over, nine of $1,000,000, one of $800,000, one of $600,000, nineteen of $500,000, one of $400,000, four of $250,000, one of $225,000, one of $200,000, six of $100,000, and one of $50,000.

THE London *Times*, the particular and especial organ of British interests, states its standpoint in a nutshell as follows: "It seems impossible to get bimetallists to understand that there is quite a large number of us for whom a general rise of prices has no charms whatever. We like them low, and the lower the better. If they all went down to half their present figures we should rejoice, because we have nothing to sell and a great many things to buy. For those who have things to sell we do not feel any great concern."

AT the Rio Tinto copper mines, in Spain, which is supposed to be the oldest "going" mining location in the world, having been opened about 2,000 B. C., the company is now working 12,000 men and $100,000,000 worth of ore has been blocked out by diamond drills. About $30,000,000 has been taken out in the last seven or eight years. About the old mine, which has seen so many nations come and go and so many dynasties rise and fall, has built up a town of 20,000 people. Though this queer mine is so old, it is even now but 400 feet deep below the surface. It is an immense body of sulphide of iron, yielding 2½ per cent in copper.

HOLDERS of unpatented mining claims should bear in mind that by the 31st of this month they must be able to show $100 worth of work or improvements done on the claim since January 1st, '95; any claim on which such amount has not been done or expended during the year is liable to relocation. It should also be remembered that an affidavit of such work or improvement should be filed with the clerk of the county or the recorder of the mining district before Jan. 1st, '96. While from a final legal standpoint such filing may not be found necessary, yet it is more economical and satisfactory to comply with State as well as federal requirements.

IT is claimed by the *Prospect* that no single mine in Nevada, Sierra or Amador counties ever had a record of yielding as much gold for either a single year or a single month as the Utica mine. The output of the Plymouth Consolidated mine in Amador county of $1,033,548 in 1884 was the greatest product in its history, and the Standard Consolidated mine in Mono county a little over $2,138,000 in 1881. Last May the Utica mine is said to have made a cleanup of something like $900,000, which is considered the largest product in its history: it has already broken the record of the Bodie Consolidated mine, which made the largest cleanup—$600,000 in the single month of July, 1878.

NEW YORK mining men are represented as undecided whether to "start a mining boom" in San Francisco, New York, Cripple Creek or Chicago. One dispatch says committees have been appointed "to look into the matter." The thing is amusing, from a Californian standpoint. If our New York friends want to "start a boom" no one can probably prevent them from trying; but no one here connected with legitimate mining cares a continental for such manœuvering. California gold mines are not listed, as a rule, and there is as much difference between investments in mines here and investments in mining shares as there is between growing wheat and buying futures in that useful breadstuff.

THE mines of Kansas produce 30 per cent of the total zinc output of the United States, and about 2 per cent of the total output of lead. Operations so far are confined almost entirely to the southeastern part of Cherokee county. The veins are not regular, and generally followed up or down, whichever direction they may go. There is very little system used, as the plan of leasing allows each prospector to work the ground in accordance with his own ideas. Companies or individuals lease a number of acres of land, and subdivide the tract into mining lots, 200 feet square, which they sublet to miners, who enter into contracts with the original lessee to mine the ore for a certain per cent, the price to be fixed according to the selling rate of lead in the St. Louis market.

BETWEEN September and the middle of last month the depreciation in South African mining stocks amounted to nearly £78,000,000, or $390,000,000. The drop in shares of the Chartered Company of South Africa was £10,000,000; the De Beers diamond mine showed a decline in the market price from 161¼ to below 130—a shrinkage of £5,500,000. The London *Statist's* Johannesburg correspondent, under date of October 14th, cites an instance where some enterprising promoters in the Rand had appropriated a portion of the title of a respectable mining proposition, and acquired some thirty claims which were on the wrong side of the dip of the gold-bearing strata, which presented no indication whatever of an outcrop of the reefs, and which, when publicly sold at auction not many months before, brought one penny per claim—less than half a crown for the whole lot. These they proposed to float in London at the modest figure of £150,000, or at the rate of £5000 per claim!

THE Elkhorn mine, which has for five years been one of the greatest gold producers in Montana, will be abandoned after next April. Superintendent Molson concludes that the ore bodies which have proved so productive on the upper levels have become too narrow and low grade to permit of their profitable working or to justify further exploration of the mine in depth. He is of the opinion that the reserve ore in sight represents about three or four months' working at the present rate of production, and that after this has been extracted the Elkhorn mine must be considered as exhausted. The company does not intend to go out of the business of mining. It announces that a plan of reorganization will be presented at a meeting of the stockholders at the London office this month. The company proposes to purchase three mines in the East Fryer Hill district at Leadville, Colo., for £86,000, in cash, and to carry on the operations of the company as before. The Elkhorn company has paid to its stockholders the amount of capital stock and 50 per cent additional, which will have been equal to 10 per cent per annum since the beginning.

Notes on Gold Milling in California.

NUMBER IV.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

The Plate-Block (*Chock-Block*) consists of wooden blocks bolted solidly together, and fitted and keyed to the lower edge of the mortar along the discharge opening, with one part projecting above the other, forming a recess on top to contain the screen frame, and lined with a piece of blanket to make a close joint. The inner side is sloped or rounded off, and fitted with an amalgamated plate. The front and ends are faced with iron plate to protect the wood. Two or more sets of these chock-blocks should be provided, of which one stands 2 inches higher than the other; they are then used alternately, the higher one with new shoes and dies, to be replaced by the lower one when the dies are worn down somewhat, to retain a more even discharge than would otherwise be possible.

The Drop is the height through which the stamp is raised by the cam, and through which it drops when released. Usually it is the same for all the stamps in a battery, although the end and feed stamps sometimes receive a different drop. It is regulated through the raising or lowering of the tappet, and depends mostly on the hardness of the rock. It is one of the factors in determining the speed with which the blows from the stamp shall be repeated. The usual combination of the two in the California mills, is a low drop with rapid motion.

The Discharge is the distance between the top of the die, when in place in the mortar, and the lower edge of the screen through which the pulp discharges. It is one of the most important factors in the duty of the stamps and the gold output from the ore. It should be maintained as nearly as possible at an even height through the entire period of crushing; the height of the chock-block or screen frame being lowered to correspond with the wear of the die. A further means used to retain an even discharge is by placing a two-inch iron plate under the dies, when worn thin. The discharge stands in a certain relationship with the fineness of the screen; low discharge goes with coarser crushing, a high discharge with the opposite. The discharge varies in California from 4 to 10 inches.

Water Supply.—Water pipes of three inches diameter are brought along the front of the mortar near the upper edge, with branch pipes one inch in diameter supplied with faucets leading to the feed side of the mortar, to convey the battery water in at the back, or through the plank covering on the top; this water is under moderate pressure. A second discharge pipe is carried down in front of the lower lip of the mortar, where a movable, perforated branch is turned across the front of the screen, discharging along the entire line on the lip; this second discharge pipe also supplies a hose. The battery water should enter both sides of the mortar in an even quantity, and the total amount must be sufficient to keep a fairly thick pulp that discharges freely through the screen. About 120 cubic feet of water per ton of crushed ore may be considered an average, or 8 to 10 cubic feet per stamp per hour.

Aprons and Apron-Plates.—The apron is a low table placed in front of the mortar, just below and in immediate proximity to the lower lip of the discharge, for the reception of amalgamated copper plates. It is set on a sufficient grade to permit the discharging pulp to flow over it in an even stream, while affording the suspended amalgam an opportunity to reach, and adhere to, the plate surface. The size, shape and slope are at the will of the millman; but usually they are rectangular, with the plates screwed down to the table with copper screws, perfectly level and smooth, the sides being secured with wooden cleats. The grade given varies from ½ to 2½ inches to the foot, and the width of the apron is usually the width of the discharge opening of the mortar. In some mills several of these apron-plates are placed consecutively, discharging from one to the other. They are usually rigid, but in some instances the apron next to the mortar stands on rollers, permitting it to be rolled back, and thus giving freer access to the front of the mortar. They should not be attached to the battery frame.

Sluices and Sluice-Plates.—These vary from 12 to 20 inches in width, and are placed below the aprons; they are usually set to a grade different from that of the apron. The plates can be fastened by cleats, or are laid overlapping at the ends, and, if not wider than 16 inches, do not need to be fastened down with side cleats; this permits of their being picked up and cleaned at any time without stopping the battery. The sluices are rarely over 16 feet long—more frequently in lengths of 8 feet—and should always be placed double. The width and grade, as compared with the apron areas, are mostly faulty in California mills.

Clean-up Barrel.—Large mills are supplied with clean-up barrels, which consist of iron barrels supported by trunnions resting in bearings on short standards. One of the trunnions is extended to carry a loose and a tight pulley, by means of which it is revolved. A manhole, with tight-fitting cover, is provided for charging and discharging, and below it is a sluice with cross-riffles to receive the pulp when discharged from the barrel. The barrel should make from thirty to forty revolutions a minute, requiring 2½ H. P. It is used to treat the battery sands when cleaning up the mill; also, all the scrapings from the mill floors, as well as sand from the drop boxes and amalgam traps, large pieces of quartz or pieces of broken shoes being added with water and quicksilver to assist in the operation.

Clean-up Pan.—This is a small amalgamating pan, 3 to 4 feet in diameter, operating with mullers with wooden shoes, and is run at a speed of thirty revolutions, requiring 1½ H. P. When in use the pan is half filled with water, and the amalgam put in, with an addition of clean quicksilver, and, if required, also some lye. After sufficient grinding, the muddy water is run out through plug-holes, the mullers stopped, and the contents drawn off in buckets. The iron found floating on top of the quicksilver is removed with a magnet; the sand is washed off with a small stream of clear water, and if any dross be found covering the surface it is skimmed off with a sponge or piece of blanket.

Cleaning-up Room.—This is an apartment in close proximity to the batteries and aprons, provided with a tight floor, and with a door under lock and key; the floor is best when laid in cement, to avoid all losses from spilt quicksilver or amalgam. It should be well lighted, and furnished with a sloping table large enough to place a screen frame on; also, with one or two water-tight boxes 4 feet long, 3 feet wide and 3 feet deep, for panning-out purposes; these are supplied with plug-holes near the bottom, to drain off the water, besides water pipes and fittings to fill the boxes when required. One or two wide shelves should be provided to hold the chemicals, quicksilver, and utensils used in cleaning up. The latter consist of pans, wedgewood mortar, brushes, scoops, cups, knives, chisels, rubbers, scrapers, and a supply of closely woven drilling or light canvas; the latter is used to squeeze the superfluous quicksilver from the amalgam. A good pair of balances, with a set of accurate weights, capable of weighing the amalgam and the retorted bullion, should also be provided. The table should be made of a solid plank, or a slab of slate or marble, supplied with a raised edge, and grooved around to drain into a pan placed on a shelf attached below the lower end; some tables are covered with an amalgamated plate. It is sometimes convenient to have a small safe in the clean-up room, but it is always better to have the amalgam delivered to the office.

POWER FOR MILLS.

On account of the favorable position of the majority of California mines as regards their proximity to mountain streams and the large ditch systems, the application of water for the motive power of the mills is rendered easy, and where the distance from these sources is remote, electricity generated in such localities and transmitted to the mill is being successfully applied. Where steam power has to be used, the well-timbered western slopes of the Sierra Nevada permit the cost of fuel to be kept at a comparatively low figure. Where both water and timber are hard to obtain, as in the desert regions of the southern part of the State, gas engines have been applied with most satisfactory results.

In applying water power, where the pressure is sufficient, hurdy-gurdy wheels are chiefly used; these are vertical wheels with narrow breasts, having buckets of various patterns radially attached to the outer circumference, the water being projected through one or more nozzles against the buckets at a low point of the wheel, allowing the water to pass from the buckets as soon as the blow has been delivered. The principal patterns in actual use are the Knight, Pelton and Dodds; the actual effective power developed by the Pelton buckets is given at about 75% to 80%. Where sufficient pressure cannot be obtained, the Leffel turbine and the overshot wheel are in use. As the Pelton wheel seems to find the most frequent application in California, it may be convenient for millmen to have the following rule, applicable to these wheels: When the head of water is known in feet, multiply it by 0.0024147, and the product is the horse power obtainable from one miner's inch of water.

The power necessary for different mill parts is:

For each 850-lb. stamp, dropping 6 inches 95 times per minute	1.33 H. P.
For each 750-lb. stamp, dropping 6 inches 95 times per minute	1.18 H. P.
For each 650-lb. stamp, dropping 6 inches 95 times per minute	1.00 H. P.
For an 8x10-inch Blake pattern rock breaker	9.00 H. P.
For a Frue or Triumph vanner, with 220 revolutions per minute	0.50 H. P.
For a 4-foot clean-up pan, making 30 revolutions	1.50 H. P.
For an amalgamating barrel, making 30 revolutions	2.50 H. P.
For a mechanical batea, making 30 revolutions	1.00 H. P.

(*To be Continued.*)

FOR supplying 580,700 pounds of powder for use in siege and coast guns, bids have been received at the War Department, as follows: Dupont Powder Company of Delaware, 25 cents for black moulded and 33 cents for brown; Bernard Peyton of California, 35 cents for brown.

The Corral Hollow Coal Mines.

The following is furnished by a representative of this paper, who recently made a thorough examination of the coal deposits at Corral Hollow:

Prospect work on the Corral Hollow coal mines is practically finished, the owners having satisfied themselves that they have in them a valuable property, and the work of putting them in shape to place their product on the market at an early date is now under way.

The existence of a deposit of coal in Corral Hollow has been known for the past thirty years, and some work has been done on the mines. The beds, however, were owned by a number of companies and individuals whose means were limited, and the work done was confined to surface workings. The coal here was of poor quality, and very little headway was made either in working the mines or introducing their product to the public.

Six years ago John Treadwell, of Alaska fame, secured the different holdings and started a systematic course of prospect work, which he has continued ever since. Few people knew the work that was being done, as Mr. Treadwell desired no publicity until he had assured himself that the mines were worthy of it.

In the course of his labors, prospect tunnels have been run on every section line for a distance of six and one-half miles along the course of the coal beds, in order to determine their direction and permanency, and no variation has been found in the coal formation in the whole distance. Some twelve separate veins of coal have been cut through, varying in width from six inches to twelve feet. The largest seam runs from ten to twelve feet in thickness its entire length, so far as uncovered, and through it run three thin seams of slate; the next largest seam is seven feet and is solid coal. At the point where the principal work has been done a tunnel has been run over 3000 feet along the coal seam, and a shaft sunk on it for a depth of 1200 feet from the surface, and over 400 feet from the level of the tunnel, has been run. At each 200-foot level a long tunnel has been run in this shaft, and through the entire workings the coal beds remain uniform in size, while the coal improves very much in quality as depth is attained. It has been thoroughly tested for steam purposes both by the Risdon Iron Works of San Francisco and the Southern Pacific Railroad and pronounced of first-class quality. There is now prospected a body of coal, including the ten principal veins, 17 feet in thickness, 1200 feet deep and 6½ miles long, containing about 20,000,000 tons. There is, of course, a much larger body than this—how large, it is impossible to say; but this amount has been uncovered and is a certainty.

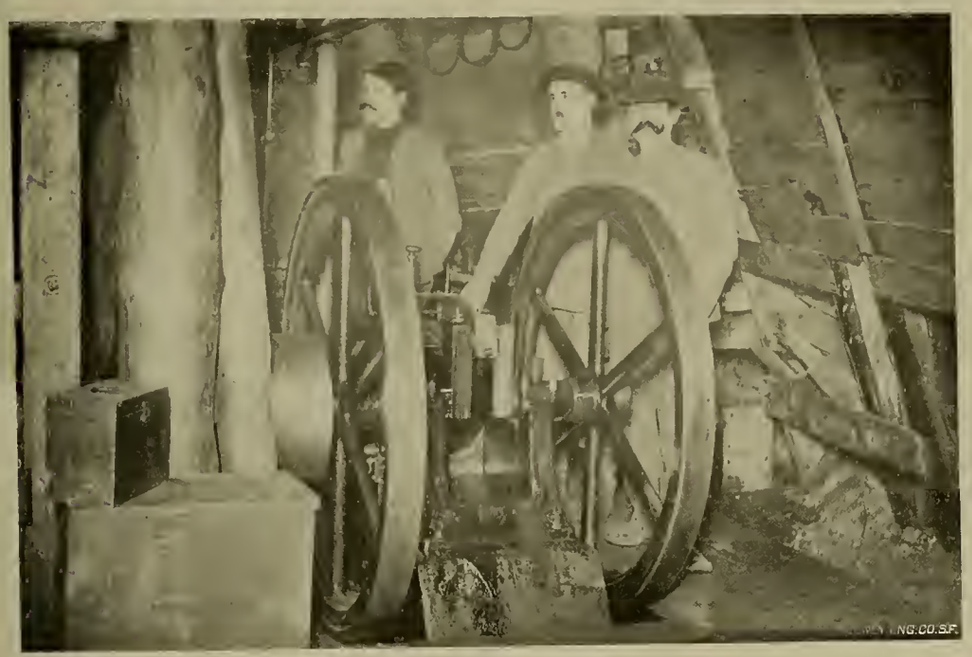
Having assured themselves of the existence of a practically limitless body of good coal, the owners are now preparing to place it upon the market at the lowest possible cost. A working shaft 22x11, divided into three compartments with a frame of 12x14 pine timbers at every five feet, is being put down at the rate of a bent a day. This is now down nearly 300 feet and follows the dip of the coal body about 56°. A large hoisting works will be erected here, from which a gravity railroad will take the coal to the bunkers at the foot of the hill.

In order to profitably market the product of these mines, the owners are now constructing the Corral Hollow railroad, which is already graded a large part of the way, and will be in operation by the 1st of March. Though these coal mines are located chiefly in Alameda county, running into San Joaquin county, they will be tributary to Stocktou, to which point the greater part of the output will be shipped direct and delivered at from $3 to $4 per ton. Over $800,000 have so far been spent in the purchase of property and preliminary work on the mine, and as much more will be expended on the road.

There is here, without question, a very large body of good coal, and it is in the hands of men who have capital and the practical knowledge to work it with profit to themselves and to the benefit of the public.

WHAT is said to be the biggest single piece of machinery ever shipped across the Alleghanies is now on the way from Philadelphia to Joliet, Ill. It is a fly wheel, weighing 180,000 pounds, made by the Southwark Foundry & Machine Company of Philadelphia for the Joliet Steel Company; it is twenty-eight feet in diameter, and the face is four feet broad. It will require a shaft thirty inches in diameter to operate it. Owing to the weight it was found necessary to make use of two especially constructed cars. The wheel was in halves, a half to a car, as it could not be transported as a whole.

AS A ship passes through the air, says Maxim, the air is divided exactly in the same manner as water would be, and as it comes together again at the stern of the ship it produces an upward current, and it is on this ascending column of air that the albatross and seagull find a resting place and follow the ship for days at a time without any apparent exertion; but whenever they find themselves in front of the ship or at one side, where there is no ascending column of air, they have often to work their passage very much as other birds do.



* Bulletin No. 6, California State Mining Bureau.

Meaning of Some Technical Terms.

Electricity is an agent of such widespread and increasing use that the newspapers are continually referring to it in one way or another, and employing technical terms that are not as fully understood by the average reader as by the professional electrician. Repeated explanation of some of these expressions, therefore, is excusable, if not actually desirable.

The best authorities in this department of science admit they do not know exactly what electricity is, although they can tell us a good deal about its behavior. In doing so they find it convenient to compare this particular form of force to a fluid, but caution us to accept figuratively and not literally the phraseology employed in doing so. The word "current," for instance, must not be construed as meaning that any matter of substance moves through the "conductor," but merely that the mysterious energy in question propagates itself along a given route in a manner resembling the flow of a fluid.

There are two forms of current, the "direct" and the "alternating." The one would be correctly illustrated by a steady stream of water issuing from an open faucet; the other, by the movement which a fluid in a pipe would have if a pump attached thereto should alternately push and suck, thus

EIGHT HORSE POWER PUMPING ENGINE IN THE PIONEER MINE.—*See page 369.*

changing the direction of the flow regularly and at very short intervals. The dynamos which generate these two kinds of current bear a close general resemblance to each other. Each has a revolving central portion, called an armature, made up partly of coils of wire, in which momentary electric impulses are excited by passing in front of fixed magnets. But the connections of the wires are such that in one case two successive impulses are merged into one continuous stream, and in the other are not only kept apart, but steered in opposite directions, when issuing from the machine.

The current is led out from a dynamo by means of two carbon bars, called "brushes," resting on the shaft of the armature, and connecting with wires that conduct the electricity to and from the place of consumption. In a direct current machine the brushes press against "the commutator," a split tube, each of whose numerous sections is the outlet for an armature coil. In an alternating generator, the brushes are in contact with a pair of continuous bands, similarly situated and called "collecting rings."

"Sparking" is the development of electric sparks through imperfect contact of brushes and commutator. The phenomenon is not observable in alternating current machines. In many modern dynamos the armature is composed of a number of thin circular iron plates, riveted together in the form of a drum, and having slots across the periphery, in which are inserted copper bars. The electricity is generated in these bars, just as in the coils of the old-style armature, and conducted down to the collecting ring, or the commutator, by means of wires which together present a pretty spiral on the side of the drum. The only true coils seen in such a dynamo are those encircling the "field" magnets fixed in the stationary outer frame.

Electricians find it necessary in generating, conveying and applying a current to treat it as if it had both volume and pressure, like water in motion. A visible fluid, for instance, may pour from a pipe in a large or a small stream, according to the quantity transmitted; and it may come out either languidly or in a jet so swift and hard as to run a mill-wheel. Volume is computed in "amperes," and pressure in "volts." The total amount of energy possessed by a current is ascertained by multiplying the number of amperes by the number of volts. The product is in "watts," and 746 watts are equivalent to one-horse power. A thousand watts, or a "kilowatt," is equal to one and a third-horse power.

For some purposes it is desirable to have a large amperage and a low voltage, and for others a low amperage and a high voltage. But a current is not always generated in just the quantity or at just the pressure required. This is particularly true where one large plant supplies electricity to several consumers, one using it for lighting, another for heating, another for welding and another for power. Hence apparatus has been devised which will change voltage. It is called a "transformer." Of course, when it raises the voltage of a current it reduces the amperage, and vice versa. The total amount of energy is not altered, except that in the process of transformation there is always a certain small loss. The instrument to which the name "transformer" or "static transformer" is now exclusively applied is capable of altering the voltage of alternating currents only. In principle this device is like two coils of wire, carefully insulated from each other, but placed together so that a current flowing in one, the "primary," excites a current in the other, the "secondary." If the secondary has ten times as many turns of wire as the primary, the voltage of the induced current will be ten times that of the original current. A well-made static transformer delivers to the secondary circuit about 96 or 97 per cent of the total energy put into the primary.

Inasmuch as the means just described are not available for altering the voltage of a direct current, one must either use the latter form of current just as it comes from the generator, or else employ a more wasteful method of conversion. If an electric motor and a dynamo were arranged so that the armatures of the two were mounted on the same shaft, and if the armature coils of the motor were wound for a different voltage than were those of the dynamo, we could lead our current into the one machine, and, by thus driving the other, could generate a second current at a higher or lower voltage than that of the first. Instead of having two entirely distinct machines, however, we could put two sets of coils on a single armature, using one set as motor coils and the other as generator coils. A machine of this sort, called a "motor-dynamo" or a "dynamotor," would change our voltage for us, but at an expenditure of about 18 per cent of our total energy.

Still another sort of change, from an alternating into a direct current, or from direct to alternating, is needed sometimes. For such service a machine very much like the one last described is employed. In a motor-dynamo, though, the leading-in and leading-out mechanism are both commutators, while in the "rotary converter" there is on one side of the armature, properly connected with one set of armature coils, a commutator, and on the other side, connected with the second set of armature coils, a pair of collecting rings. Whichever side is used, then, by the driving current, the other side will give out its own peculiar type of current.

Even the best conductors of electricity, such as copper, offer some resistance to its passage. The larger the wire, the more easily the current will flow, and the less will be the loss of energy from this source. But if the line be a long one, the cost of the copper may be too great. Fortunately, though, a current can be sent over a smaller wire at a high voltage than at a low one. Hence, for long distance transmission, it is customary to use a "step-up" transformer at the generator end of the line, and a "step-down" transformer where the current is to be applied. The great Niagara dynamos generate alternating currents, and do so at a voltage of 2000. To supply a consumer engaged in making aluminum with a "low tension" direct current a static transformer is used to get the voltage down to 115, and then a "rotary converter" completes the alteration. But for transmission to distributing centers in Buffalo, Rochester, Pittsburg, Syracuse and more distant points, the current will no doubt be transformed up to at least 10,000 or 20,000 volts, and possibly 50,000 or 60,000. Lord Kelvin once suggested the possibility that electricity might be sent from Niagara to New York City at 80,000 volts. At present 14,000 is the highest actually in use anywhere, although 20,000 was employed on the famous Lauffen-Frankfort line in Germany, 110 miles long, operated for a few months in 1889. During part of that time a pressure of nearly 30,000 volts was employed.

Asphalt in America.

The following has been condensed from advance sheets of the annual report on mineral resources by the United States geological survey.

The amount of asphaltum and bituminous rock produced in the United States in 1894 was 60,570 short tons, valued at $353,404. Compared with 1893, this shows an increase in product of 12,791 short tons, but a decrease in value of $18,832. The increased production was due to greater activity at the bituminous sandstone mines, both in California and Kentucky, while a decrease in the production of the purer forms of asphaltum in California and Utah is accountable for the comparative falling off in value. There was no bituminous limestone mined in Utah during 1894. The product, therefore, was limited to bituminous sandstone and hard, or gum, and liquid asphaltum. The production of these materials in 1894 is shown in the following table:

	Short Tons.	*Value.*
Asphaltum	9,700	$195,800
Bituminous rock	50,870	157,600
Total	60,570	$353,400

Divided by States, the product was as follows:

States.	*Short Tons.*	*Value.*
California	51,187	$251,991
Kentucky	5,383	21,400
Utah	1,000	35,000
Texas	3,000	45,000
Total	60,570	$353,400

The following table shows the annual production of asphaltum and bituminous rock in the United States since 1882:

Years.	*Short Tons.*	*Value.*
1882	3,000	$10,500
1883	3,000	10,500
1884	3,000	10,500
1885	3,000	10,500
1886	3,500	14,000
1887	4,000	16,000
1888	50,460	187,500
1889	51,735	171,537
1890	40,841	190,416
1891	45,054	242,264
1892	87,680	445,375
1893	47,779	372,232
1894	60,570	353,400

The total amount of hard and liquid asphaltum produced in California during 1894 was 5790 short tons, and of bituminous rock 45,397 short tons, the aggregate value of which was $251,991.

The entire product of Kentucky is bituminous sandstone, all of which is used for street paving in the interior cities. The product in 1894 was 5383 short tons, valued at $21,409, against 1129 short tons, valued at $6570, in 1893.

A considerable deposit of asphalt has been noticed in Park county, Mont. The material is unusually pure.

The imports of asphaltum into the United States include hard asphaltum from Cuba, Trinidad asphaltum from the island of Trinidad, off the coast of Venezuela, South American, and bituminous limestone from Neufchatel and Val de Travers, in Switzerland, and Seyssel, in France.

The following table shows the imports of crude asphaltum since 1880:

Year.	*Long Tons.*	*Value.*
1880	11,830	$87,889
1890	73,861	223,368
1891	102,433	299,350
1892	130,255	336,868
1893	74,774	196,314
1894	102,505	313,680

Mining Summary.

CALIFORNIA.

Amador.

THE BELLWETHER.—The purchase price of the Bellwether is stated to he $110,000: the new proprietors hegin operations Jan 2, '96.

BAY STATE.—Supt. Jones of the Bay State, opened up a tunnel from the west side of the mine above the hoisting plant recently and milled some rock from a ledge which crops out in the hillside above their works. The returns were $6 per ton in free gold. He has five stamps at work on ore from this tunnel, while the other five are at work on ore from the mine. He is running a crosscut from the shaft at the 100 level to the new ledge.

AROUND DRYTOWN.—A "revival" is reported from the old mining district of Drytown. Negotiations are in progress for the sale of of the Loyal or Black Hills claim for $40,000. The property is bonded for that amount to L. H. Newton of San Francisco and Mr. Gray of Oakland.

The Gover mill and mine will soon be in operation again.

LACKS AUTHENTICITY.—According to local reports, the Cramp brothers, ship builders, are interested in the Philadelphia reduction works and claim to hold patents on appliances, by the use of which they can work sulphurets at a cost of $3 per ton. Some months ago they thought they had arrangements made to construct a plant to use their process at Angels, to handle the products of the Utica company, but at the last moment, and after they had shipped six carloads of material to the State, some hitch in the arrangements developed which caused them to decide not to erect a plant at Angels, and their agents commenced to cast about for another place to locate. An Amador paper says tbe Cramp's representatives are now engaged in making tests and chemical analysis of the ledge matter for several miles, on either side of the Cosumnes river, and have under consideration the consolidation of a large number of claims at that point, the erection of a large number of batteries, probably 100 stamps to begin with, and the erection and installation of reduction works of sufficient capacity to handle the product of their mills.

Calaveras.

THE TULLOCH MINE.—At tbe Tulloch mine, the mill is now ready to crush the 700 tons of ore now on the dump.

TO ERECT WORKS.—*Prospect:* Mr. Sceiffert says that the company who have his mine under bond have authorized their agent, Mr. Deidesheimer, to at once erect all necessary machinery for working the Sceiffert mine, and to sink as soon as possible. Mr. Sceiffert will receive a good portion of the purchase money Monday. From all appearances the company is in earnest about this property and in a few months will no doubt have it well under way of development.

THE GWIN MINE.—The shaft of the Gwin mine is down 1050 feet.

El Dorado.

PLACERVILLE, Dec. 4.—(Special Correspondence)—J. Bryant & Son are constructing a 10-stamp mill on their property, four miles southeast of here. They are crosscutting on the 60-foot level. They have 100 tons of ore ready to be milled.

The Lady Emma, six miles northwest of this place, has a 2-stamp mill in operation for prospecting purposes. The results thus far warrant the erection of additional stamps in the spring. The property is owned by F. W. Beardslee.

Rainy & Smith are building a 10-stamp mill on their quartz mine, four miles northwest of Placerville.

Development work on the Wykel mine, five miles southeast of here, is progressing rapidly. Mill tests of ore yielded $8 per ton. This is owned by Shaub, Sturtevant, Cade and Taylor of Oakland.

J. E. Spencer is erecting pump and engine on the old Hagar mine, nine miles south of town, with a view to sinking deeper in the old shaft and doing development work on this one-time productive plant.

The Linden gravel mine, two miles east of here, owned by A. Sinclair of Boston, has in operation a 10-stamp mill that crushes 75 carloads of 1800 pounds each per day. The gravel is carried through a bedrock tunnel 4000 feet long. The plant comprises 300 acres.

The old Havilah mine was reopened within the present year and is running 20 stamps on high grade ore. This is situated twelve miles below Placerville and is the property of A. Harpending.

Development work recently begun on the Larkin mine, three miles from here, is progressing favorably. This property is squarely on the mother lode. D. H. Jackson is working it under a bond.

San Franciscans bave bought the old Mt. Pleasant, near Grizzly Flat, and are reopening the old works with vigor. This was a famous gold producer in its day. Rock recently found is high grade.

R. M. Mooer has bonded the old Boh Red properties and is pushing tunnel and shaft ahead rapidly. Selected ore from the tunnel assays very high.

The old Pocahontas, celebrated in its day as a gold producer, is being rehabilitated by English capital. The work that is being done is of a substantial character, with a view to enabling its present owners to work the property with system and for many years to come. It is situated seven miles south, in Old Logtown, one of the richest camps at one time in El Dorado county.

This county has plenty of good properties awaiting the capitalist's attention. The old abandoned mines that are being worked to greater depth are rapidly proving a good investment. Favorable terms can generally be made, either for a bond or outright purchase.

A PREDICTION.—*Gazette*: A table of gold production by counties, published in the MINING AND SCIENTIFIC PRESS, gives El Dorado for 1892, $198,321; for 1893, $295,830; for 1894, $367,063. Reckoning from the scores of busy stamps, the hydraulic mines started up, and increased mine development which started within the past year the gold product for 1895 cannot fall short of $600,000 and will prohably reach the million mark by the close of the coming year.

THE OLD JONAS BITTERS CLAIM.—*Gazette:* The Two Channel Mining Company, with H. E. Picket as manager and W. C. Green supt., has taken hold of the Shoofly, (hetter known as the Kenna mine) Wilton, Tiedeman, South Otter and Yellow Jacket, hesides several new locations, and altogether have now thirty men at work. The property extends from Missouri canyon on the north to a half mile south of the Eight Mile House adjoining the Lake Tahoe road, a distance of more than four miles.

Humboldt.

A Eureka dispatch says a week ago a dozen Japanese contract laborers went to Gold Bluff, in the northern part of Humboldt county, to take the place of the white men working in the mines there. The Americans had been told that the Japs were to arrive, so they organized, and when the Japs put in an appearance tbe spokesman told the coolies they could stay over night, but that in tbe morning they must go back to where they came from or there would be trouble. This was sufficient. The Japs beat a basty retreat, the Americans warning them not to return. The owners of the mines have thrown the white men out of employment and trouble is feared before a settlement is reacbed. It is reported on good authority that the Japanese had come up to labor for $5 per month and board.

Kern.

RANDSBOROUGH.—Fifty miles N. E. of Mojave, ten miles east of the Goler district is Randsborough mining district in the desert, 5000 feet above sea level, where 100 men have about twenty-five locations tbat show free gold. Dry washers are mostly in use. Wood and water are the great wants and until the latter is found in sufficient quantity and transportation facilities are better the camp cannot attain the heigbt of its fortunes.

THE CONFIDENCE MINE.—George Montgomery will haul freight from Daggett to the Confidence mine, in Death Valley, over a hundred miles distant. It is eight miles northwest of the Ibex mine, and has a ledge 50 feet wide, of fine milling ore. Fifteen feet of this mills $40 to $75 to the ton, while tbe remainder runs $15 to the ton. He is putting in a 30-ton Bryant mill, and is seven miles from the mine. Gasoline is used to run the engine, that being the cheapest fuel obtainable.

Mono.

THE GREEN CREEK DAM.—The Standard Con. Mining Co's. dam at Green creek is finished. It is twenty miles from Bodie and spans Green creek canon 4,000 feet above the power house. It was planned by Andrew Smith of Bodie and constructed under bis supervision. R. G. Brown, Supt. of the company, had 85 men at work on it this past summer.

The foundation is of pine logs three feet in diameter, and is 57½ feet wide and 80 feet long. The depth of the toe-piling below the foundation varies from 15 feet in the center to 9 feet at the sides. The toe-piling runs into blue cement and bed-rock, and is made of hewn pine logs pointed up with cement. The dam is 42 feet bigh and varies in length across canyon from 80 feet at bottom to 235 feet at top. Its width varies from 57½ feet at bottom to 15 feet at top. The front has a batter of 45 degrees: the back has a batter of 1 foot in 4. The dam proper required 1000 tamarack logs with an average diameter of 16 inches and an average length of 32 feet. These were built up in crib-work of 10-foot squares filled with stone and gravel.

The timber in the lower half of dam is pinned together with iron pins 22 inches long hy 1 inch in diameter; the upper half is treenailed with 2-incb pins 2 feet long made of butt cuts of tamarack timber. The back of dam is covered with 3-inch planking corked with cedar bark, on hearings 3 feet from center to center at bottom and 3 feet 9 inches at top. The spillway proper is 37 feet high: its slope varies from 18 feet at bottom to 35 feet at top. The apron of the spillway is 30 feet long, 18 feet wide, 5 feet high, and required 72 hewn logs each 36 feet long in its construction. The spillway is braced to the dam secure against snow. The opening for this on top of dam is 35 feet long and 20 feet wide, divided into six equal spaces containing regulation gates to control the overflow.

The storage reservoir has an average length of 1000 feet; 250 feet in width, depth varying from 10 feet to 32 feet, giving it a capacity of about 24,000,000 gallons.

On the west side of the dam is the fishway 300 feet long inside measurement, 3 feet in widtb by 2 feet in depth. It contains 118 buckets or fish-rests, and required over 11,000 feet of lumber in its construction. It has a fall of 1 foot in 7 feet, and at the upper end is connected with the reservoir by a suitable bulkhead made of 4x6 timbers arranged as gates to control the flow of water through it.

Under the spillway and extending into the dam are two tunnels, each 14 feet long, 6 feet wide and 10 feet high. These tunnels are frost-proof and each contains a 24-inch valve weighing 1500 pounds, which are secured to the pipes hy lead joints, one heing for the purpose of emptying the dam when necessary, the other feeding the 4,000-foot pipe line which leads to the power house. The line is divided into four sections with pipe varying from 24 inches in diameter at dam at 18 inches at power house, middle sections being laid with 20 and 22-inch pipe. The 18-inch is all lead-jointed while that of the other sections is slip-jointed.

The reservoir is fed by springs, melting snow and several small lakes in tbe vicinity of Castle Peak.

Nevada.

GOT THE WATER OUT.—*Transcript:* All the water is pumped out of the Yellow Diamond mine and Supt. Jacobs will now continue the development of the property on a larger scale. They are now at the point where exceedingly rich gravel was encountered just before they were forced to suspend operations.

PITTSBURG MINE SOLD. — The Pittsburg mine, situated near the Town Talk, was sold last week to S. Granger for $3,300. He had to satisfy judgement on foreclosure of mortgage.

THE LINDSEY BONDED.—*Union:* The Lindsey mine, Washington mining district, bas been bonded to J. B. Tully of Grass Valley.

WILL RUN A TUNNEL.—The lessees of the Enterprise mine, formerly the Gold Tunnel, who have heen doing development work on Lost Hill for some months past, have moved all the machinery and materials near to a point on Deer creek, where they intend to commence a tunnel.

THE KENTUCK MINE.—S. Blight has begun work on the Kentuck mine, opposite tbe Maryland. The shaft is down 250 feet.

AROUND WASHINGTON. — The California mine employs twenty men. D. Harmon is superintendent; W. Williamson, foreman.

About the same number are at work at the German.

At the Spanish mine about 130 tons are daily crushed. Superintendent, D. Johnson.

At the Oak Tree mine the twenty stamps are at work.

A contract will be let at the Washington mine for sinking 200 feet from the 400 level.

THE BULLION MINE.—G. Mainhart tells the *Tidings* that as soon as tbe electric power furnished by the Nevada County Electric Power Co. is available the Bullion mine will put in dynamos and the machinery will be run by electricity. The plant will be an extensive one and will he the first mine in the district run by electric power.

Placer.

BLACK HAWK BONDED.—The Black Hawk gravel mine, north of the Mayflower, has been bonded to Dr. Brewer, of this city, for eighteen months, with privilege of purcbase for $40,000: $6,000 has been put up for development.

EVENING STAR MINE.—*Sentinel:* Sacramento capitalists have located a river claim near Colfax which tbey have named the Evening Star mine. They have located a portion of the American river from a short distance ahove Shirt Tail canyon to a point above Indian canyon.

A numher of gravel banks will be worked during the winter. Next summer it is the intention of the company to turn the river for a long distance and clean up the hedrock.

Plumas.

THE SHENANDOAH.—Supt. King, of the Shenandoah has run twenty-two tons of roasted ore through the mill, but the gold would not amalgamate. From the run, however, 3300 lbs. of clean, dry sulphurets were saved and shipped here.

THE PLUMAS IMPERIAL.—*National-Bulletin:* The work of fitting up the Plumas Imperial mine has been concluded, the force of men employed coming down to Quincy Wednesday. The property is now ready for active working next spring.

Riverside.

THE GOLDEN CHARIOT.—A ledge of ore has been uncovered in the Golden Chariot mine in a drift driven twenty-five feet from the hottom of the 300-foot shaft. The Golden Chariot is an extension of the Santa Rosa.

Sierra.

GOLD VALLEY.—At the Gold Valley mine fifty-six men are now engaged in development work; ore enough is taken out to keep a small mill at work. After the mine is opened to a depth of 300 or 400 feet, more extensive machinery will probably be put on. The mine is about twelve miles above Downieville.

BOUGHT BY SCOTCHMEN.—A Glasgow syndicate has bought the Alaska and Grizzly near Pike City. The company has a capital stock of $225,000, of which $100,000 is to be devoted to putting the Alaska in better shape, developing the Grizzly and putting in additional machinery. The present idea is to sink a new shaft outside the ledge or drain the present workings by a tunnel. It is helieved that 20 additional stamps will be put in next spring.

Siskiyou.

GENERAL MINING NOTES. — *Union:* The Commodore mine, on Barkhouse creek, back of Walker P. O., Klamath river, was discovered by R. E. Billups last July, and is owned and operated by Billups & Humphreys of Yreka. They have run a tunnel 100 feet and tapped the ledge at a deptb of 140 feet, and then ran a crosscut tunnel 150 feet. They have also a raise of 75 feet. The ledge runs from 18 to 36 inches in width, as shown by a winze sunk; rock averages $30 to the ton. They have a twin arrastra capable of crushing four tons a day.

The Bunker Hill mine, 18 miles below Happy Camp, owned by G. B. Temple, is sold to Hughes & Hilbert for $10,000.

The Thomas mine, near Cottage Grove, is in operation at present, and is paying from $60 to $80 a day, averaging about seven dollars a hand.

The Gold Ball Mining Co. has leased to the American Mines Association of Montana, four claims in Liberty mining district, and agrees to furnish $5,000 in cash for the purpose of erecting an 850 lb. twenty-stamp mill and all necessary machinery to make a complete mill. The life of the lease is twenty-seven months.

Lamb's mill at Yreka creek, is busy crushing ore taken from the Wademan mine on Green horn.

Trinity.

CLOSED DOWN.—The Strode Bros'. mill and mine near Trinity Center closed down on the 12th ult.

AROUND TRINITY CENTER.—*Journal:* At the Altoona mine, John Stridger, supt., ninety-five men are at work; the mine will run steadily through tbe winter. Enlarged machinery for pumping and boisting has heen put in and preparations are being made to sink for two new levels.

At the Integral mines the force has been increased to sixteen men, who will develop the property this winter.

At the Nash Deep Gravel mine on Coffee creek, the Trinity Gold Placer Mining Syndicate, W. Maitland, supt., have twenty-two men sinking in the deep channel to reach hedrock to drift and running a 600-foot tunnel through a rocky point to obtain grade and dump for bydraulic mining.

The Rainhow company on Coffee creek have been sinking to open a drift claim on the creek, and have struck good pay a short distance from the bed-rock. They are also developing a quartz prospect two miles from their drift claim.

The Bonanza King owned by Vellmers, Ellery, Doty and Fillman have closed the mill for the season. Men will be kept at work on the mine through the winter running tunnels, developing and caring for the property. Since Aug. 4th of this year six miles of road and one and one-half miles of trail have been dug and graded; a five-stamp mill aud engine has been hauled in, set up and put in running order, 150 tons of rock have been packet on mules from the mine to the mill and crushed. The results of the crushing were entirely satisfactory to the owners.

Tuolumne.

THE STARR MINE.—A ten-stamp mill is heing completed at the Starr mine. A strike has been made recently. They have drifted on the ledge 100 feet, the ore still showing well in the face.

Yuba.

SMARTSVILLE MINES.—The Smartsville correspondent of the Marysville *Appeal* says the Excelsior Water and Mining Company will shortly resume operations there.

NEVADA.

ESMERALDA COUNTY.

THE GERTIE ORE.—Thirty tons of ore from the recent strike in the Gertie mine near Coryville, worked in the mill last week produced a gold bar worth $2,000. This ore was taken out by four men in a month.

SILVER PEAK.—The cyanide has arrived and the leaching is going on. There has heen considerable ore taken out recently that will mill $30 per ton. The tunnel, which is heing run to open the ledge and to tap the mine generally is more that half completed, and it is expected that two months more will finish it.

RETURNED $2,000.—The lessees of the Big Indian, or the Gertie mine, milled 30 tons of ore that returned them about $2000.

Owens' Bros. have taken out 300 tons of $80 ore from the New Party mine in Silver Star.

OREGON.

A CONTENTED MAN.—W. H. Miller has a ledge on Soldier creek near the Illinois river, wbere he mortars $10 to $12 a day. He has no disposition to bond, sell, form a stock company or put on a big force of men, but quietly pounds out the gold dust from day to day, lives all alone, and is rich and content. The ledge is there; he owns it; his wants are few, and he is as "independent as a hog on ice." This dream of wealth and content is realized twenty miles west of Kirby.

AT GOLD BASIN.—About eighty men are at work at Gold Basin getting ready to turn water. Several hundred acres are believed to average thirty cents to the cubic yard. The gold fields are not in a basin, as the name implies, but on the side of a high ridge where water has to be hoisted to a height of 2500 feet. This hoisting process is where the difficulty and expense come in, and a series of powerful pumps will be put in operation. The mines are not far from the Josephine and Coos county line.

SOLD CHEAP.—The property of the Oregon Gold Mining Co., located at Cornucopia in Union county, was sold by the sheriff under execution last Tuesday. This property had heen valued as high as $500,000 and was sold several months ago under execution for $9000, which amount appeared so inadequate that a resale was ordered; hut it was bid in the second time by the same parties and at the same figures as formerly.

WASHINGTON.

METHOW DISTRICT.—The Ben Lummon Gold Mining Company has incorporated; capital stock $2,500,000; to operate the Ben Lummon group of mines, including the Little Giant, Ben Lummon, Exchange, Florence, Grace, Columbia and North Star, on the Twisp river, Methow district. Incorporators: L. M. Boardman, J. S. Parker, W. R. Marvin, D. B. Fotheringham, W. S. Dawson, W. France and W. Lockhart.

BRITISH COLUMBIA.

SOLD HIS INTEREST.—Rossland *Miner:* James Breen has sold his interest in the Trail smelter to W. A. Clarke, of Montana, for $20,000 cash. He remarked when he showed the draft for that amount. "This is pretty good for a summer's work" It is to be inferred from this that Mr. Breen acquired his interest by his expert services, part of which consisted in making a contract with the Le Roi Mining Company for 75,000 tons of ore at $11 per ton. It is understood he will remain in charge of the smelter for one year at a salary.

GENERAL NOTES.—The jumping of the Homestake mine at Trail Creek did not interfere with the work. The new syndicate is going ahead with development under the direction of J. M. Burke.

The Pend d'Oreille Hydraulic Mining Co., operating near Waneta, will put in a pump with great capacity.

Ore has recently been uncovered in the

North Star mine, in the East Kootenai, which is said to run 205 ounces in silver and 40 per cent lead.

A mining association has been organized at Fort Steele.

There were 140 mining locations recorded in the Fort Steele district this year.

It is claimed that there is "auriferous gravel enough in Cariboo, B. C., to keep miners busy for 600 years."

UTAH.

BIG REDUCTION PLANT.—Capt. De Lamar will in the spring erect a mammoth reduction plant for his Golden Gate group. He will also erect an expensive hoisting plant and is getting the property in shape for production.

AT BLAKE.—At Blake, eastern Utah, the Bennett Amalgamator Manufacturing Company are putting up a $60,000 mill to work the mines on a large scale. It is claimed for Mr. Bennett's machine that it will save particles of gold ore almost invisible.

CAMP FLOYD DISTRICT.—The Old Fred Gold Mining and Milling Company has incorporated; capital stock, $2,500,000. Incorporators—C. Burkhalter, Wymore, Neb.; J. L. Atkinson, Evanston, Wyo.; H. F. Menough, G. H. Leighton, A. B. Gibson, E. McCarrick, Salt Lake City. The company will buy and operate the Old Fred, Old Fred No. 2, Ouida, Homestake, Apex, Nugget, Defense, Pluto, all located at Sunshine, Camp Floyd district.

IDAHO.

THE COEUR D'ALENES.—The Bunker Hill and Sullivan mine employs 400 men. The tramway daily conveys 500 tons of ore from the mine to the concentrator.

Thirteen thousand dollars was disbursed to the workmen at the Last Chance mine last pay day.

Both the Chest mills are running on a slightly better quality of ore.

Another five-stamp mill will be located three-quarters of a mile from Murray.

The Standard mine and mill has closed down owing to the scarcity of water.

The gravity tramway from the You Like mine is nearly completed. Mining men are complaining about the unusually low water in that section. The recent cold snap has diminished the flow, and many of the mines and mills have been compelled to shut down for lack of power. On Canyon creek only two mills are running—the Tiger and the Frisco. The Tiger is using steam power. The Poorman, the Standard and the Granite are all closed down. At Mullan the Morning is also closed down by the same deficiency.

ANOTHER ACCIDENT AVERTED.—*Avalanche:* At the time of the fatal accident to Foreman Schott at the Poorman, all work in the face of the adit tunnel and the upraise was discontinued, pending its inspection by the State Mine Inspector. Luckily this action was taken, for shortly after the miners were withdrawn the water broke through the face of the tunnel, demonstrating that old workings are in close proximity. The precaution of General Manager Grothe in ordering a six-foot hole drilled ahead at the breast has probably saved many lives, as it was from this "feeler" that the break occurred, although some time subsequent to its being drilled. These recent developments at the Poorman are very discouraging to the management. They had every reason to believe that they had two hundred feet of "backs" at that point, and find that instead they are in a nest of deserted and decayed workings, not only lacking in ore, but dangerous in the extreme to investigate. There should be a law compelling mining companies to keep maps and records of their underground works, so that the disappointments and accidents experienced by this company could be avoided in the future. The mill at this property is running steadily from ore extracted in other portions of the mine.

LARGE PLACER OPERATIONS.—A crew of men are working on the placer claims on Salmon river, at the mouth of John Day, preparing for extensive work next spring. These claims were purchased from George Alkire by a syndicate of Spokane Republican politicians, consisting of U. S. Senator Wilson, State Senator Ide, ex-Register Strong and others. They have been operating the ground all summer and report good results. They are now constructing 7,000 feet of new ditch and flume which will give a fall of 340 feet to the boxes. It is being built along a dangerous shale bluff. The flume is two feet deep and three feet wide and will carry about twenty cubic feet of water per second, or from 800 to 900 inches. A No. 2 giant, with 14-inch nozzle, will be used. The boxes are thirty inches wide and set on a nine-inch grade.

MONTANA.

A POLE TRAMWAY.—The Chicago and Montana Mining Company contemplate putting in a pole tramway from the Snowshoe mine to the Great Northern station at Libby. Such a tramway can be cheaply built and is very effective. No iron is used in the rails, which are made of heavy poles jointed together. All that is necessary is a good even grade and a logging locomotive, the surface of the wheels of both locomotive and car being concave (similar to a pulley wheel) have a flange on each side of the rail, which adjust themselves readily to any slight inequalities of roadbed or track. The road will be 17 miles long.

SOUTH DAKOTA.

RAPID CITY CHLORINATION PLANT.—Deadwood *Pioneer*: When M. H. Day returned from California to Rapid City a few months ago he conceived the idea of having the chlorination plant at Rapid City started up on Bald mountain ores. He quietly secured an option on the plant, which had been sold at sheriff's sale, and on a number of claims around Bald mountain, and then went to Boston to enlist capital. A stock company has been organized in Boston and money enough has been paid in to secure the mill, and the mines will all be taken before the bonds expire. The mill, which it is estimated cost from $80,000 to $150,000, was secured for $20,000, and the mines are all bonded for about the same proportion of their value.

COLORADO.

A BUSY OFFICIAL.—The county clerk at Colorado Springs says that over one hundred papers per day pertaining to bonds and leases in that district are being filed for record.

ARIZONA.

The National Mining Development and Brokerage Company, with headquarters at Portland, Maine, has bonded the Swiss Girl group of copper mines for $25,000. These mines are located twenty miles east of Prescott, two miles from the Black Canyon road. The new company will start work in the 54-foot shaft of the Swiss Girl and sink it to a depth of 154 feet, will build wagon roads and put the camp in shape for active work. At the same time development work will be pushed on the Alice, another claim of the group. A smelter and general reduction works is also contemplated, as ore from Chaparral, Big Bug and the Bradshaws is all tributary to this point. The works will be on the Agua Fria, where water is abundant and the S. F. P. & P. fourteen miles away.

YAVAPAI COUNTY.

THE GOLDEN NUGGET.—The Burke Mining Company has incorporated to operate the Golden Nugget mine and adjacent placer claims in Big Bug district. The incorporators are D. A. Burke and B. J. McQuin of Prescott. The Golden Nugget is developed by two shafts, each over 70 feet in depth and each shaft showing a vein of ore five feet in width.

PIMA COUNTY.

At NOGALES.—There was filed last week a deed from W. J. Cheyney, of Abecon, N. J., to the Montana Camp Gold Mining Company to two mining claims, the Montana Camp mine and the Philadelphia, in Oro Blanco district. The consideration is $580,000, payable in stock at $2 per share.

MEXICO.

SONORA.

THE MINAS PRIETAS ROASTERS.—The new roasters at the Minas Prietas mill operate upon tailings taken from the dump conveyed to the top of the roaster building, above the mill, by a wire rope tramway, dumped on a receiving floor; thence passed to a drying floor, consisting of plates of iron laid at the top of the back end of the furnace, there pulp is mixed with five per cent of ground salt, turned once while in that part of the process; when completed it is shoveled into carriers on each side, which convey it to elevators. The latter empty the pulp into bins, whence it is fed into the roasters by automatic feeders. The roasters are large iron cylinders, sixty-two inches in diameter and thirty-six feet long. They are revolved by a gearing of cog wheels connected with a three-horse power engine, and can be made to travel fast or slow, as to the length of time desired to subject the pulp to the roast. The roasted pulp falls through the furnace to a chamber below, whence it is conducted to a cooling floor. Thence it goes to the battery pans in the mill. The two roasters handle each fifty tons of pulp daily.

ECUADOR.

THE PLAYA DE ORO.—Jno. P. Petty, who was recently at Nevada City and Grass Valley looking for experienced miners to go to the Playa de Oro mine, in Ecuador, S. A., sailed last week for the property, where he will act as general manager. It is a New York company and has recently completed a very large hydraulic plant, having a capacity of 5000 inches, expected to wash from 15,000 to 25,000 cubic yards of gravel, with a daily output of $10,000.

The gold deposits in that district cover 200 square miles. There is an abundance of water, and the gravel is said to average 15 cents a yard. C. Van Issebot, chief engineer of the Ecuador Gold Mining Company, adjacent to the Playa de Oro, is on his way to that property with a view of overseeing the installation of the plant now being constructed in this city, and to be sent to Ecuador by the 1st of January.

Until Americans acquired the property the Indians and negroes have been washing out the gold in small quantities in their bateas or wooden dishes, and have supplied their wants in that way for 150 years.

The Government of Ecuador is now constructing telegraph lines, which will soon put these properties in direct communication with New York and San Francisco.

These placer fields are looked upon with great interest by the Government, which has issued a special pamphlet describing these properties, known as Bulletin No. 64, the only document of the kind ever issued by the United States Government.

A Question Answered.

Under date of November 30 a subscriber writes from Siskiyou county:

Would you kindly answer the following questions in an early issue? We have an ample water supply about one and three-quarter miles distant. What pressure, and horsepower, will be developed at lowest point (terminus) through 15-inch pipe with 170 feet pressure? Also, number of inches of water available for delivery through same, no elevations en route? Also, like questions applied to a 6-inch pipe, one and three-quarter miles long, and 170 feet pressure?

[Fifteen-inch pipe, 9240 feet long, 170 feet head: maximum, 59.6 H. P.; 368 cubic feet per minute; 115 feet effective head. As applying to 6-inch pipe: 6.4 H. P.; 39 cubic feet per minute; 115 feet effective head; efficiency of water wheel, 75 per cent. The paragraph, "Power for Mills," page 372, this issue, also applies to the matter.]

Coast Industrial Notes.

—No California-made boiler has ever been known to explode.

—The Canadian seal catch for '95 was 69,595, a decrease of 27,879 from the catch of '94.

—A 10-cent rate between San Francisco and Vallejo has temporarily demoralized the retail trade of the latter city.

—The number of idle men in this city is increasing, due, mostly, to the present low rates of travel between here and Oregon.

—Oakland will hold an industrial exhibition beginning the 16th inst., at which the industries of Alameda county will be fitly represented.

—The Southern California Railroad will extend its lines nine miles, through Elsinore to the coal and clay mines, and connect with the main line at South Riverside.

—Gen. Craighill, Chief of Gov't Engineers, reports the completion of twenty-five casements for defense and asks $100,000 additional for submarine mines and appliances.

—H. T. Scott of the Union Iron Works has signed a contract with Secretary of the Navy Herbert for building gunboats 14 and 15. The cost of 14 will be $219,000 and of 15 $223,000.

—"A pine needle industry" sounds singular. At Grant's Pass, Or., a factory is to be established to make oil, wool and soap from the needles of the pines which abound there.

—*Bradstreet's* reports 43 failures in the Pacific Coast States and Territories for the week as compared with 19 for the previous week and 23 for the corresponding week of 1894.

—F. M. Smith, "the borax king," has bought the narrow gauge California and Nevada railroad. The announced price is $150,000 cash. It is said he will extend it to Walnut Creek.

—On the S. F. and S. J. V. R. R. track is laid six miles from Stockton. About 150 men are employed in construction work. A temporary track will soon be laid across the San Joaquin. The road to the Corral Hollow mines will be completed by Feb. 1, '96.

—San Francisco's new City Hall is in process of completion. The cornerstone was laid nearly twenty-five years ago—Feb. 22, 1871. The construction has been delayed and the structure, like all similar buildings, has cost twice as much as it would or should have cost private parties.

—The San Francisco demand for Los Angeles oil justifies the erection of large tanks, which will be located at the Potrero. One 35,000-gallon tank will soon be in place there. Others of lesser size will be built. The Exchange is now shipping by rail to San Pedro, but will shortly pipe the oil to that point and put on a tank steamer to carry it from there here.

—It is proposed to organize "The Bend Power Co.," with $500,000 capital stock, to establish an electric plant on the Merced river above Horseshoe Bend. A concrete dam thirty-five feet high is projected at the latter point, the water to be conveyed thence by ditch and flume, 1½ miles, giving 93 feet fall; it is calculated 1800 H. P. can be developed at the lowest stage of the Merced with a minimum of 4000 H. P. The idea is to furnish power to all the mines of the district. H. H. Clark of Coulterville and F. M. Hopkins of this city have present charge of the proposition.

—Travertine from Inyo county will be a portion of the California structural material in the new fifteen-story building to be erected corner Third and Market streets, this city, and marble will also enter largely into its composition. This State possesses some of the finest beautiful marbles. The California "sienna" marble is of a rich, yellowish tint with markings of sepia; the "Ramosa," a gray ground with dark markings like those in a moss agate and rust-colored blotches; "white and gold," well described by the name, but with fine moss markings; "black and gold," having delicate white streaks. Chemically these marbles are very pure dolomite, close-grained and compact, and equally well adapted for exterior and interior work. They are susceptible of a very high polish. They are said to crush at 36,000 pounds pressure.

—Charles S. Reeves of Tacoma has evolved this plan for the defense of Puget sound: He would, at the entrance to the sound or at the most advantageous point near Port Townsend, have a steel cable laid across from shore to shore, having attached to it a cast-iron magnet sixty feet square, wound with the requisite thickness of insulated wire. The magnet would be placed below the water, and in the track of incoming ships. To the ends of the cable would be attached electric dynamos of large capacity, and through wires connected to the magnet a powerful current would be conveyed, making the huge instrument an attraction to steel warships passing over it that could not be resisted. In other words, the scheme would be to draw the invading fleet, vessel by vessel, below the waters of the sound, electrocuting the officers and crew, and making the valuable armament the property of Uncle Sam.

—Work on the Alameda and San Joaquin railroad, or as it is commonly known, the Corral Hollow road, is being pushed ahead. It is completed for six miles out from Stockton and track is being laid at the rate of a mile a day. The road is all graded to the mouth of the Corral Hollow canyon, through which for a distance of six miles there is some heavy grading, but it is expected that the road will be completed to the coal mines and be ready for operation by the first of March next. The first construction train over the road pulled out from Stockton at 2 o'clock on the 3rd inst. and consisted of two cars of rails, three of ties, and two flats devoted to invited guests, some 200 in number, among them the mayor and city council of Stockton. The train remained two hours, during which time a large force of men were at work and over a quarter of a mile of track was laid. The road is now within eight miles of the San Joaquin river which will be reached in a little over a week. A temporary trestle-work bridge crosses the river, and it will be replaced by a steel drawbridge before spring. The work on the road is of the best description and is evidently intended for permanent business. The ties are close, and the rails are 56-pound Bessemer steel.

—A very interesting pipe line has just been constructed and laid by the Risdon Iron and Locomotive Works for the North Star Mining Company of Grass Valley. The diameter of pipe is 20 inches, and is 7000 feet in length. The working pressure at the lower end of pipe line is 300 pounds per square inch. The heaviest material used was ⅜-inch steel, and the lightest—some 2500 feet at the head of pipe line—was No. 9 B. W. G. steel, the pressure on portions of the lighter pipe being 225 pounds. At the lower end of the line a receiver 24 inches in diameter by 40 feet long was constructed, the connection to pipe being made with cast steel flanges. The receiver is provided with one 12-inch branch leading to Pelton water wheel and one 8-inch relief valve. The air chamber is 18 inches in diameter by 20 feet long, made of lap-welded pipe with ends riveted in. This sets on top of receiver, with 4-inch connections and shut-off gate. It is also provided with inlet air valve and check valve and water-gauge column, including two pressure gauges reading to 500 pounds. The material used in receiver is ⅜-inch mild open-hearth steel; and it will be interesting to engineers to note that when the line was completed and the test pressure of 400 pounds per square inch applied, the pipe and receiver not only successfully withstood the shock, but they were bottle-tight. It is claimed that this pipe line is working under a heavier pressure than any riveted pipe heretofore constructed on the coast. A. D. Foote, who is the consulting engineer of the North Star Mining Company, designed the entire plant, and the construction at the shops, as well as the laying of the pipe, was under his immediate supervision.

Personal.

A. B. PAUL has returned from Sierra county.

C. D. LANE is bonding mining properties in New Mexico.

JIM WARDNER is figuring on further developments at Kennedy, Nev.

GEORGE E. AMES of the Union Iron Works has returned from Montana.

J. V. KEELEY has returned to Vanderbilt district, San Bernardino county.

HENRY JANIN left here this week for London, where he will remain all winter.

LOUIS WEBB of Siskiyou sails for South Africa this week, to join his brother Harry.

A. H. WALRATH has gone to Brown's Valley, Yuba Co., to take charge of the Old Flag Mining Co.

DR. ADDISON, of the General Electric Co., has returned from a pleasant sojourn on the Atlantic coast.

J. B. TONKIN, formerly of Salmon River, is now foreman of the Iron Mountain mine, Shasta county.

J. J. HILL will resign the presidency of the Great Northern on 31st inst. to accept that of the N. P. R. R.

JOSIAH GILBERT is now general mine superintendent of the Butte & Boston and Boston & Montana companies.

V. C. GRAY, formerly of Shasta county, has returned to the superintendency of a mine near Mazatlan, Mexico.

DR. FRED H. HATCH has returned from London to Johannesburg, S. A., to resume his work as mining engineer.

CARL SNYDER of New York is here preparing an article on California's gold mines and mining for *Harper's Weekly*.

IRVING M. SCOTT is the subject of a pleasant biographical sketch, with portrait, in the current number of *Cassier's Magazine*.

HERBERT LANG is located at Shasta, Cal., and has charge of the new furnaces building at the Risdon Iron Works for the Mountain Mining Co. at Keswick.

CAMILLO CERRUTI left here this week for Paris, France, where he purposes establishing a bureau for the representation of California mining properties.

WILLIAM IRWIN, formerly of Bodie, has acquired wealth by mining investments in Australia. Henry Callaghan, formerly of Nevada county, has charge of one of Mr. Irwin's properties at Brown's Creek.

R. H. DUNCAN, general superintendent of the Merced Falls Electric Power and Manufacturing Co., is at Merced, and announces his intention to put in a plant at Merced Falls, where sufficient power exists to meet the wants of that section.

C. P. HUNTINGTON is to arrive at Coatzacoalcos, Mexico, next week, to take a trip over the National Tehuantepec Railroad, with a view of leasing or purchasing the property from the Federal Government, which now has it in successful operation.

COLONEL MCROBERTS, promoter of the Merced and Yosemite Railroad, has returned from Mariposa county. He says the surveyors are in the field above the Horseshoe bend, are compiling a report of the entire route, and making estimates of every fill and cut between Merced and the Yosemite valley.

H. P. GORDON, of Plymouth, Cal., is now superintendent of a new hydraulic mine at Minersville, Trinity Co. He was for over a year foreman of the North Bloomfield mine, and has mined in Montana, Oregon, Idaho, Costa Rica, U. S. of Colombia and Ecuador. He still thinks California is the miner's paradise.

Scientific Progress.

Cyanide of Potassium in Hardening Tool Steel.

Discussing the use of cyanide of potassium for steel-hardening purposes, T. R. Almond, Brooklyn, N. Y., suggests this salt assists the hardening process because of its powerful dioxidizing properties, and also because it forms a liquid film on the surface of the steel, which causes a more perfect contact between the steel and the water, thereby permitting a more rapid abstraction of heat. The inevitable formation of a thin coat of oxide is unfavorable to the process of rapid cooling; and as rapid cooling seems to be the one thing necessary for success as to hardness, any means used for the removal of a bad conductor of heat, like the black oxide, will be of advantage, and more especially if this means also results in the formation of a liquid film on the steel surface having the affinity for water which, it is well known, is peculiar to potassium cyanide. Mr. Almond recommends the removal of all scale or oxide from the surfaces of steel to he hardened, either hy pickling or by the cyanide. Steel covered with a very thin film of oxide will take the heat less quickly when immersed in hot lead than if the steel be hright before heing immersed. This being the case, it would seem to follow that, because of a film of oxide, heat will leave steel more slowly when being cooled by water.

Shops producing their own tools exclusively are becoming scarce. Homemade contrivances are giving place to machinery perfected hy specialists and installed on the purely business principle that they will lower the cost of the product. Making a special study of the needs of each industry has not only furnished better tools but decreased their cost in corresponding proportion. The machine shop that would undertake to huild a lathe or horing mill for itself would find itself greatly handicapped in the matter of cost, when compared with the regular tool works. But even leaving the question of first cost aside, how would the home product compare with that of a firm making a business of building such tools? Would it give the same degree of efficiency with the same expenditure of power?—Cassier's Magazine for December.

The work of the Coast and Geodetic Survey on the Alaska boundary has so far progressed as to the line hetween Alaska and British Columhia as to show that there will be very little change from the line run by Ogilvie, the British surveyor, in 1889. The line crosses Forty Mile creek ahout eight miles from the mouth of the Yukon river, which will leave a portion of the gold fields in British Columbia. The question of ten marine leagues from the sea coast as to the eastern boundary is more difficult, but the United States will not recede from the position that it must be computed from the maiuland and not from the islands.

Scientific progress on this coast will receive considerable impetus if it be brought about that Dr. Harkness will vacate the presidency of the California Academy of Sciences in favor of Prof. Jordan. "Superfluous lags the veteran on the stage" might long have been applied to the incumbency of the former gentleman, whose mental habits were not conducive to progress in the institution which so far has greatly failed to come up to popular anticipation or fill the functions prescrihed hy its founder, Jas. Lick.

For hygienic purposes, the floors of the hospital wards in Lyons, Fraiuce, are covered with a solution of paraffine in petroleum, which gives them a hrowu tint and makes them impervious to "everything." A single application is said to last two years. Thus prepared, the floors can be wiped daily with a damp cloth, moistened with some antiseptic solution. The floors of schoolrooms, barracks, etc., and of private houses, when uncarpeted, can he treated in the same manner with advantage.

New Electric Caustic Soda Process.

A new process for the manufacture of caustic soda and hleaching powder promises to give long desired results. Hitherto caustic soda and bleaching powder have been produced hy au old process, which has from time to time heen improved. By this process, caustic soda could not he produced for less than $30 per ton, or bleaching powder for less than $27 per ton. The new method is said to reduce the cost of manufacturing caustic soda to $21; and of hleaching powder to about $15. There is, however, a further economy. The ordinary quality of caustic soda corresponds to what is technically known as 70 per cent Liverpool test, whereas the soda produced hy the new process answers to 78.5 per cent, Liverpool test. The new system is hased on the employment of a moving hody of mercury, the amalgam of which is decomposed electrically as soon as it is formed. The cells employed are, it is stated, only one-fifth the size used in any other process, actual or proposed. A stroug point in the new method is that it requires very little lahor, being almost entirely automatic.

Photographs are now printed by the hundred by machinery. Starting with the roll of sensitized hromide paper, which is unwound in a room illuminated hy red light, fed under two or more negatives to which it is automatically pressed, and at the same time exposed hy the flashing of incandescent electric lamps above the negatives, then moved along the proper distance for a fresh section to be exposed and finally wound up on another roller. The roll of exposed film is next removed to another room and automatically developed, moving from one roller to another through the different dcveloping baths, fixed, alumed, washed and dried, the fiuished pictures being wouud on a final roll, ready to be cut to size and mounted on cards the usual way. Its capacity is 245 "exposures" of cabiuet pictures a minute.

The telephone system now in operation in the United States has deharred one-half million messenger boys from earning a living; the type-setting machines have displaced thirty thousand printers; the pneumatic cash carriers in stores have dispensed with the services of ten thousand cash boys and girls. A few years ago ten thousand girls rolled the cigarettes now made by machiuery. The cable and electric lines of railway of the country have rendered useless millions of horses and mules, and thrown out of employment thousands of men whose duty it was to care for them.

Dr. Gustav Eisen has published an account of his receut explorations in the cape region of Baja California, which throws considerable light on that comparatively unknown land. The accompanyiug maps differ from former ones as to mountain chains, their direction, etc., and are presumably correct. The doctor collected nearly 1000 new forms of animal life, and his book adds largely to the sum of knowledge of that peninsula.

It is figured that if the street-car service now in operatiou in the city of Chicago were effected by horses, as formerly, it would require 30,000 horses, 3000 stablemen to take care of them, 1500 blacksmiths to shoe them and 5,460,000 bushels of oats and 1,000,000 tous of hay to feed them annually.

Compressed air is now proposed as a motor in street-car service in this city and Oakland. It is in successful use in some eastern and central cities.

Mechanical Progress.

A New Clock Dial.

The new dial represented herewith is an improvement on the old patterns. The inventor started out with the idea of making the hour hand traverse the dial in the same time that the sun on the average traverses, or seems to traverse, the path around the earth.

It will he seen that the dial represents the rising of the sun, its progress to the zenith at nootide, and to its final disappearance below the horizon at nightfall. But the disc, instead of heing divided into twelve spaces, is divided into twenty-four, marked from one to twelve in two series. The upper half of the dial represents day, and the lower half night, and the two are distinguished hy the very natural expedient of making "day" white and "night" hlack, with the additional precaution of printing "day" and "night" in conspicuous letters on the respective hemispheres. On the outer rim will be observed the scale for the minute hand. This scale is divided into sixty parts, every fifth part being marked with its appropriate figure. This, again, does away with a source of ambiguity in the present system. People are accustomed to say "a quarter of" and "a quarter after," or "twenty-five minutes of," all of which expressions have a greater or less tendency to cause mistakes. By the new dial there can he no errors. Take, for instance, the position of the hands as represented in the diagram. They mean a certain time, and no other time. The small or hour hand is hetween five and six, and as this hour hand represents the sun, we see that it is sinking toward the horizon. In other words, it is between five and six o'clock in the evening. The precise time is known when we look at the long or minute hand. This is poiuting directly at fifty-five. The time is, therefore, five hours and fifty-five minutes in the evening, or five, fifty-five, as railroad men say. According to the common method of telling time you would say that the diagram shows five minutes of six o'clock, P. M.

Another improvement connected with the day-and-night clock dial is an invention to simplify the reading of time tables by incasing the figures that indicate the arrival and departure of night trains in heavy hlack. Everybody who has had occasion to travel has suffered the tortures of the time table. Most women are absolutely unahle to fathom the mysteries of a train schedule. The trouhle is mainly caused hy the little "A. M.'s" and "P. M.'s" that are coustantly springing up in the most unexpected places and in the most distressing manner. The new arrangement does away with this difficulty at one blow. If all railroads should adopt the new system, it would almost be a pleasure to read time tables. There is absolutely no chance for error. And then not only would the reading of the schedule he an easy matter, but the traveler "of the long voyage" could see at a glance just how much time his trip will occupy, and what part of it will be performed at night and what part in the daytime.

The most curious thing ahout this invention is that it has never heen thought of hefore. But in that respect it resembles a great many other important discoveries.

Tubes Made from Solid Metal.

Advance sheets of a consular report hy Consul General Mason, at Frankfort, give a description of the Erhardt process of manufacturing tuhular bodies out of solid metal, without casting, boring or welding.

A cuhe of steel is heated cherry red, and dropped into a massive matrix of the outward form required. A mandrel is then thrust forward hy immense hydraulic pressure. It enters the steel cube, and presses the metal outward to fit the depressions in the matrix. Owing to the force exerted, the metal yields like butter, and gives an exact impression of the hollows in the matrix.

The advantages of this treatment are the uniform strength and consistency given to every part of the article produced, with the utmost lightness compatihle with sufficient strength to endure necessary strains.

Already the German Government has adopted this method of making the outer casing of shrapnel shells, to the exclusion of all methods formerly in use.

The process has also been applied to the manufacture of gun barrels, hollow flasks for containing liquefied carbonic and other acids, and parts of machinery where lightness and strength are desirahle.

It may also he applied to the manufacture of hollow ware, and its usefulness is not confined to articles made of steel. Wrought iron, copper and other malleahle metals are susceptible of the same treatment, the only condition heing that each metal should he worked at the temperature which insures its greatest amount of malleahility and ductility. Seamless copper tuhes of twenty feet in length have already heen produced with commercial success hy this process.

In the old method of horing the solid hlock it often happened that the strongest and densest part of the metal was turned into shavings. Under the Erhardt process this is impossible, as the compression gives the finished block au equal and uniform density, without seams or flaws.

Wire Measuring Machine.

A wire measuring machine has heen constructed for the use of wire manufacturers, contractors and others who may require to keep a constant check on the quantity of wire or cable payed out or reeled in. It consists of a strong but light steel wheel, mounted on a cast iron frame, and having a fine worm cut on the spindle geared into a worm wbeel. This drives a train of clockwork connecting the hands of the dials which indicate units, tens and thousands of feet or yards, or meters, according to requirements. To prcvent error due to slipping, there is a small roller on the top of the wheel upon which the length to be measured runs. This roller presses the wire or cable onto the wheel. This machine would prove a great convenience, as by means of it cables and wires can be automatically measured during or after process of manufacture, or before being sent out for a temporary task, as well as after they are returned. Adjustable contacts can be fitted to the dials to ring a bell when any desirable length has passed.

J. W. Powers of Minneapolis, Minn., is aunounced as having invented a steam engine in which he is able to entirely dispense with the dead center. "The engine will start from any position." Mr. Powers claims that, in his, a steam gauge put in the head of the cylinder will show exactly the same register as the gauge upon the boiler. He will probahly modify some of his views later on.

Recent accidents here and in Oakland emphasize the necessity of constant care on the part of workers with and among machinery. A machine has no intellect, no pity and must be handled with caution. In this regard "'tis better to be foolishly careful than carelessly foolish."

Electrical Progress.

Electro-Plating for Ships.

Electro-plating with copper the iron hull of an ocean-going tug is being done at Jersey City. The invention, it is believed, will solve the problem how to protect the hull from barnacles and corrosion. The hull of a wooden ship can be protected by nailing on sheets of copper, but this method cannot be used on an iron vessel. If the sheets of copper are bolted directly to the iron, galvanic action is set up by the salt water and the iron plates are eaten away.

The process consists in depositing a layer of copper upon the iron by means of tanks filled with a solution of copper and subjected to the action of an electric battery. These baths, three feet square and six inches in depth, are laid flat against the side of the vessel, shaped so as to fit the curvature and watertight by being jammed up against the iron hull and then packed with oakum round the edges. Three sets of baths are used in the process and the entire operation takes about two weeks.

The first bath is of sulphuric acid, which cleans the iron plates and prepares them for the deposit of copper. Twelve hours is sufficient for the cleaning process, when the baths are removed, cleaned and replaced on the hull, then filled with a solution of cyanide of copper, which, by means of pipes and a pump, is kept in constant circulation through the baths. The positive pole of a powerful battery is then connected with two copper plates placed in each bath and the negative pole to the iron hull of the ship. A thin layer of copper is soon deposited on the plates covered by the bath, which is called the sinking coat, and serves as a foothold for the copper deposited by the succeeding bath. After the cyanide has been removed from the baths, a solution of sulphate of copper is introduced, which acts in the same way as the cyanide solution. The action of the electric current which passes through the baths subtracts the metal from the copper plates in the bath and deposits it upon the striking coat obtained by the cyanide bath. When about three-sixteenths of an inch has been deposited the baths are removed and the coat of copper is thoroughly burnished. It is then in almost perfect unison with the iron plates and cannot be removed except with a cold chisel. Heavy blows with a hammer do not produce any impression upon it and it is practically part of the iron.

A Rubber Craze.

One of the most interesting of current events, from the view-point of the electrician, is the newly developed production of rubber in Lagos. In 1893 no imports of this article were recorded as received from the colony, and last year the amount was only $29,970: By a single steamer, which left Lagos at the beginning of last month, however, the value of the rubber shipped to Liverpool was $75,000. The new industry has taken hold of the inhabitants of Lagos indiscriminately with the rush of the gold craze. Numbers of clerks, small traders and others, even, it is said, professional men, have packed up their traps and gone into the interior to take their chances in collecting and manufacturing the gum. The native owners of forests have a shrewd appreciation of the bearing of this unwonted excitement, and are insisting on the payment of royalties. Some of them are even entering into the business of preparing the rubber for the market. Prices in the interior have been considerably advanced, and there is no longer as much profit as there was at first in purchasing and transporting the product to the coast. The fear among electricians that an artificial rubber would have to be resorted to in consequence of the increasing scarcity of the natural product has, for the present at all events, been allayed. In many rubber sources the wholesale destruction of trees by the natives has been stopped, and odd kinds of rubber are cropping out from unexpected quarters. Several new sorts, together with the familiar little black balls with a white center, come from the West Coast of Africa. A new product comes from Madagascar. It has a horny appearance and contains much earth. Nothing certain is known of its botanical origin.

An Electric Jib Crane.

An electric jib crane, constructed under American patents, is doing good work in conjunction with a 3-horse power bipolar motor, and lifts with case a weight of over two tons. The electric current is obtained from the lighting circuit of the works. The economy of this electrical application is shown by the fact that when the crane was worked by hand power, and with the usual chains and bars required in handling steel billets, it took six men one hour and a half to do that which is now done by three men in one-quarter of an hour. This electric crane is also used for unloading boiler plates. These are often 4½ feet wide, 22 feet long, and weigh 1500 pounds. The special advantage of this form of crane is found to be its adaptability for the quick moving of all forms of heavy masses of iron and steel. It is of great service not only in the handling of ingots, bars and plates, but in the speedy manipulation of iron and steel goods in a more finished condition.

An electric plant is being put in for lighting the business portion of New Wilmington, Pa., to be operated by a 20-horse power gasoline engine, in connection with dynamos and with storage batteries. This is said to be the first plant of its kind in the United States using the three-wire system in connection with a gas engine and storage battery.

Send for Special Mining Machinery Catalogue.

The Boom Gold Mines.

These mines, fully developed, giving high grade, free milling gold, with all the machinery, mill, buildings, water, must now be sold for a song, to raise money for private purposes. Maps, reports of engineers at command; title clear; no misrepresentation. Investment positively safe. Everything new and complete. Correspondence desired that means strictly business. A splendid chance for a small investment.

CHARLES F. KUHNEN.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

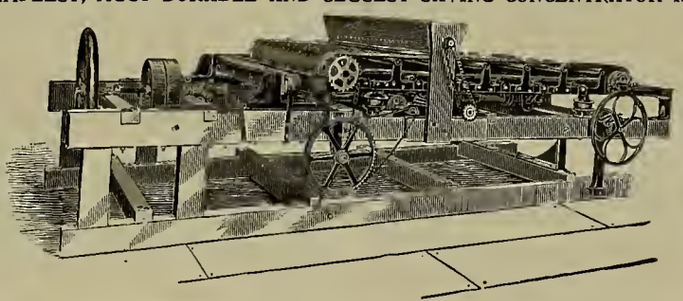
The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.



Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE ..... $350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully
E. L. BALLOU, Propr. Ballou Reduction Works

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 5, 1895.

There is a dullness in all the metals except lead, which shows considerable life. The market generally is unsettled. Under date of Nov. 18th, James Lewis & Son's report on copper, from Liverpool, says: "A combination of adverse circumstances has brought about a decline of £1 7s 6d per ton in the value of good merchantable copper since the 1st inst. The lower range of values is mainly due to the steady and continuous selling of American copper for delivery over the next eight or nine months, as well as of good merchantable copper on American account. It was thought that support would have been given to the market by the firms largely interested in Anaconda, Boleo and Rio Tinto shares (the former having sold at £5 10s and the latter at £15), but this has not been forthcoming. American exports for the first half of November are 2150 tons. Stocks have decreased 4014 tons, and the visible supply 3538 tons, during the past fortnight. Imports to date are 5772 tons less, and deliveries 5514 tons greater, than last year. The arrivals in England and France for the fortnight have been 2835 tons, and the deliveries 6849 tons. The arrivals of Chili in Liverpool and Swansea have been 250 tons, and the deliveries 1976 tons, and from other countries 1550 and 3411 tons fine respectively. The arrivals in Liverpool and Swansea from the United States have been 133 tons bars and 644 tons matte, equal to about 497 tons fine, and in France 175 tons fine. The Chili charters for the past fortnight are advised as 900 tons, and exchange 17⅝d. No sales of furnace material have been made public. Quotations to-day are: Chili bars and good merchantable copper, £43 15s for cash and £44 2s 6d for three months' prompt; English best selected ingots, £48 5s to £48 15s, and tough cake, £47 10s to £48 per ton; ore of 20 per cent, 8s 6d; regulus and matte, 8s 9d per unit."

Mining Share Market.

SAN FRANCISCO, Dec. 5, 1895.

The market has shown more activity. While there seems to he more life, yet the outside puhlic are slow in taking hold. This is due to the vast majority having been so hadly victimized on the long sides through false moves; they fear to venture in until the market acts as if moneyed men, not scalpers, are handling it. The former want good sized deals, but the latter are content with small gains. It is also said that quite a number of outsiders still hold good lines of shares—waiting to unload at high prices. So far as can be ascertained there is nothing yet developed in the mines to justify insiders coming in openly and operating on the hull side. It is easy to send the market up with money hacking, hut it is not so easy to unload, for dealers are scarce, unless the proposition is hacked up hy more merit in the miues than has been found, or at least so far as the public knows, at any time within the past seven years.

The upmove reported last week in Occidental did not last long, for the shares soon set off again. Then Bodie came to the front and made one of its characteristic fake moves, but this upmove seemed to have stirred up the Occidental people, for the market value of the shares in this mine douhled in quick order on a street report of ore strikes, which caused the shorts to fill and which also brought in a few of tbose outsiders who are always anxious to take a "flyer" for fear of being left. But it did not last, for prices soon broke. On the upmove the balance of the market sympathized slightly, hut there was lacking an element of strength, which does not indicate stahility. The assessments heing collected will tend to keep the Comstocks down, for those holding shares become sellers just before they become delinquent, besides there are always short sellers at hand prepared to sell so as to make assessments. This is against the market.

The news from the Comstock mines is far from discouraging. On the contrary, it is quite encouraging from one end to the other of the lode. In the Alta group active exploiting work is still the order, hut much of it seems to he in the nature of not making any development until the work is further advanced on tbe different levels. This applies to the other groups as well as to the Alta group. From a gambling point of view, it is not right; but from a legitimate business standpoint, it is thoroughly correct, for there have been too many disappointments and heavy losses hy outsiders to warrant mine managers doing anything to excite the cupidity of dealers unless the development in the mines bave heen shown hy work to justify it. In the Gold Hill group the work is still to the west. It is heing prosecuted on several levels, whicb looks well for the future, provided miners' expectations regarding the west lode are realized. Several of the mines are extracting a few tons of ore daily, which meet part of the expenses at least. In Alpha there has heen quite an improvement, hut for reasons hest known to the management it is not fully made public. Prohahly after more work has been done, so as to see if it is something of importance, it will be given out. The improvement is to the west and ought to favorahly offset both Con. Imperial and Exchequer. Perhaps there are too many shares of the two latter out on the public to admit of their appreciating much in value. In the middle mines they are digging away, while lawyers down here are digging away in the Hale & Norcross suit. The latter have the advantage in keeping the shares depressed and not selling as high as the prospects in the mines warrant. While the work is being pushed to the west on several different levels, yet every favorahle showing is followed up to see what it will lead to. A few tons of ore are extracted each day, with Potosi turning out the largest quantity. In Gould & Curry and Best & Belcher the work is still of an uninteresting character to outsiders, hut to miners it is full of interest. In Con. Virginia, Ophir, Mexican, Union and Sierra Nevada the work is similar to that heretofore reported; hut as it is prosecuted interest should increase correspondingly. It is reported, and on seemingly good authority, that the north-end group of mines are in splendid condition, and that an improvement has taken place in one or more. As the work is in the right direction, it would not be surprising if the rumors are correct; yet, until they are verified from official sources, conservative and well informed mining men will not venture an opinion, let alone operating in the shares on the strength of the reports. In Andes the work is more or less overlooked by the outside puhlic, yet it is quite important.

From the Brunswick lode the news is quite important, still it does not justify huying the shares of the mines on that lode, except for a gauhle. There is nothing reported so far which warrants buying, with the hope of securing anything more than assessments. The work is now largely of an exploiting character and something of value may he found, hut time alone will disclose it. The work heing done deserves close watching.

From the outside mines there is nothing of interest to report. The work in the mines in the Columhus and Tuscarora districts is unattractive. In the Bodie district, work still continues of a kill-time character while making a bluff at doing something very important. More assessments will have to he levied in this group. When work is extended to the lower levels there will he every prospect of something quite important heing found in one of the mines at least.

The following is the usual monthly statement of moneys on hand:

BONIE MINES.		E. Sierra Nev..	$	29	22

Assessment Notices.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on tbe fourth (4th) day of November, 1895, an assessment (No. 59) of twenty-five cents (25 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 309 Montgomery str et, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the ninth (9th) day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Assessment Notices.

BULLION MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1895, an assessment (No. 46) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine street, San Francisco, California.

SUPERIOR MILL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placerville, El Dorado county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the fifth day of November, 1895, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 916 Market street, Room 81, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and un ess payment is made before, will be sold on WEDNESDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. HOWARD BARNARD, Secretary.

Office—Room 81, 916 Market street, San Francisco, California.

THE JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the ninth day of November, 1895, an assessment (No. 7) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of December, 1895, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 6th day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 2), of three cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Rooms 37 and 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 16th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—37 and 38 Crocker Building, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 77) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United states gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of December, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block. No. 309 Montgomery street, San Francisco, California.

CON. CALIFORNIA & VIRGINIA MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 22d day of November, 1895, an assessment (No. 5) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the sixteenth (16th) day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

CONFIDENCE SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 13th day of November, 1895, an assessment (No. 26) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the sec etary, at the office of the company, No. 414 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 8th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. S. GROTH, S cretary.

Office—No. 414 California street, San Francisco, California.

WANTED.—POSITION AS ASSAYER OR Amalgamator. Capable to take charge of mine and mill. Over 25 years experience.

C. S. A., 1212 So. O Street, Tacoma, Wash.

MINING SHAREHOLDERS' DIRECTORY.

Compiled Every Thursday from Advertisements in the Mining and Scientific Press and Other San Francisco Journals.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 26, 1895.

550,433.—ABDOMINAL SUPPORTER—Annie L. Babington, Oakland, Cal.
550,244.—MINING APPARATUS—C. Bingburn, S. F.
550,363.—FRUIT WASHER—G. W. Deane, Riverside, Cal.
550,493.—TRUSS—J. Fandrey, Santa Barbara, Cal.
550,410.—GAS GENERATOR—A. Harding, Oakland, Cal.
550,347.—TRAIN STARTER—J. T. Langlais, Berkeley, Cal.
550,515.—GOLD-SAVING APPARATUS—A. S. Laszkievicz, Martinez, Cal.
550,517.—CONCENTRATOR BELT—W. J. Loring, Angels Camp, Cal.
550,397.—CLAMP FOR BANJOS—W. A. Todd, S. F.
550,426.—WAGON LOADER—G. M. Wallace, Yuba City, Cal.
24,923.—DESIGN—V. A. De Prosse, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHILIAN MILL.—Martin P. Boss, San Francisco, Cal. No. 550,038. Dated Nov. 19, 1895. This mill consists of crushing wheels, a vertical shaft by which their travel is effected, and means for connecting the wheels to the shaft, comprising a vertical sleeve feathered upon the shaft and adapted to move freely vertically, said sleeve being formed with integral gudgeons, one ou each side of the axles of the crushing wheels, each having an integral partial hub which, when fitted together, forms a complete journal-box to receive the gudgeons of the sleeve, and means for uniting the sections of the hub and for rotating the shaft. This mill is set in a frame which carries the overhead bearing of the vertical shaft, said frame comprising stringers having the bearing of the shaft and supporting walls, and an ore bin anchors said stringers upon one of the walls.

MEAT CUTTER.—Wilhelm Hundenborn and Adolph Backhausen, Elherfeld, Germany. Assignors to Siegmund Kohlberg, of same place. No. 550,071. Dated Nov. 19, 1895. This invention relates to that class of meat cutters in which the material is fed to knives mounted upon a perforated disk rotating in a vertical plane. The device consists of a casing or shell formed into two cylinders in planes at right angles to each other, one of the cylinders being the feeding cylinder and the other the cutting cylinder. The feeding cylinder has a supply hopper, and has one of its sides flattened. A roller is mounted eccentrically within the feeding cylinders and operates closely against an abutment or wall formed at the junction of the two cylinders at one side of the center only, whereby an opening is formed below the abutment for the passage of the material from one cylinder to the other, said roller having a slot made diametrically through it and extending approximately the entire length thereof. A single pusher plate is mounted to freely slide in said slot of the roller, and cutting disks are mounted in the cutting cylinder which operate in planes at right angles to the rotation of the roller.

AXLE GAUGE.—Rufus A. Simpson, Ferndale, Cal. No. 550,061. Dated Nov. 19, 1895. This invention has for its object to provide a gauge for accurately measuring the dish, as it is called, of a wagon wheel, and for use in indicating the set of the axle to correspond with any given dish of wheel. It consists of bars pivoted together, having fixed and adjustable plates extending transversely across them and projecting beyond the edges of the pivoted plates and adapted to rest upon the wheel rim at opposite sides, an adjustable plate intermediate between these transverse plates having an arm adapted to rest upon a central spoke when the others rest upon the rim, so as to give the dish of the wheel a transverse gauge and pointer forks, which indicate the dish, and arms having forks which diverge outwardly from the centers of the sides of the pivoted bars, so as to clasp the axle and retain it in a central line of the bars while the gauge is inspected to ascertain the set of the axle.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Wm. A. Roberts and John Graham, in the Forest Home mine, Amador county, to impound tailings behind a dam in Arkansas creek; from James T. Ish, in the Bull Neck mine, near Volcano, Amador county, to impound tailings in dry ravines; from Henry Dickerman et al., in the Mill Gulch mine, near Amador, Amador county, to impound tailings behind a dam below the mine; from John G. Ramm, in the Jay Bird mine, near Camptonville, Yuba county, to impound tailings below the mine; from Schillanskey & Co., in the Wild Yankee mine, Shady Run, Placer county, to impound tailings behind a dam in a ravine; from W. H. Cole, in his mine in Mountain Tp., El Dorado county, to impound tailings behind dams in a dry ravine; from A. B. Jacks and John Clifford, in the Badger Hill mine, near Spanish Ranch, Plumas county, to impound tailings behind a dam in Woods Ravine; from John Schafer, in the Pine Leaf mine, near Spanish Ranch, Plumas county, to impound tailings in an old pit; from Geo. C. Sargent, in the Quaker Hill mine, Nevada county, to impound tailings on a flat south of Deer Creek; from James Meehan, in his mine near Aquednct City, Amador county, to impound tailings below the mine; from J. N. Findley, in the Trafton mine, near Yankee Jims, Placer county, to impound tailings in a ravine below the mine; and from George W. Smith, in the Irish Hill mine, near Oleta, Amador county, Cal., to impound tailings behind a dam in a ravine—gives notice that a meeting will be held at Room No. 82, Flood Building, San Francisco, Cal., on Dec. 23rd, 1895, at 1:30 P. M.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Certi.	No. Shares.	Amt.
M. J. McDonald, Trustee	294	5,000	$500 00

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special monthly meeting held on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on November 2, 1895, the above sale is postponed to MONDAY, the 2d day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on December 2, 1895, the above assessment is postponed to TUESDAY, the 31st day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

ANNUAL MEETING.—THE REGULAR ANNUAL MEETING of the stockholders of the Gould & Curry Silver Mining Company will be held at the office of the company, room 69, Nevada Block, 309 Montgomery street, San Francisco, California, on MONDAY, the 16th day of December, 1895, at the hour of one o'clock, P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, December 13, 1895, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

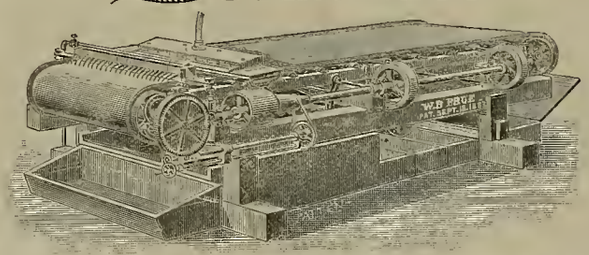
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect; Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.



This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can he safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can he relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distrihuting the strain in the solid rubher, and bringing virtually no strain either at the edge or at the hase of flange, as is the case in all helts with a raised edge.

RISDON IRON WORKS,

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO. October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been runnl g steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2300 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amonnt of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold ama gamator it is unequaled by any mill now in existence. Yours truly.

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly. JOHN BECK. Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE. Sec'ty.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly,

JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE. Sec'ty.

GREAT SALT LAKE AND HOT SPRINGS-RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Glyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly.

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER. President.

THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Power From Ocean Waves.

How to utilize wave power has been the effort of many. To such effort is added one more modification of the old idea by a company recently organized here called the Wave-Power Air Compressing Co. "to compress air and distribute power." Herewith is illustrated the proposed mechanism. The intent is to do away with the necessity for using coal or other fuel in the generation of electricity by utilizing wave-power compressed air, conducting it to engines operating dynamos for electric power. Fig. 1 shows the perspective of eight proposed air pumps; figure 2 is a longitudinal section through one of these eight; in it the sub-figure 5 is a vertical section of one of the air pumps D and part of an air pipe G, showing the check-valve g and receding valves g^1, g^2, g^3, g^4, the guide bars k and the universal joint n connecting piston m and piston rod o; 7 and 8 show the piston rod; 9, 10, 11, 12 the receding valve and the grooves in their rim; 13 is a plan of the piston; 14 the same, from underneath; 15 is a plan of the check-valve g, showing oil-holes and channel; 16 is a plan of the air pump, showing the guide bars k and the valve-seats.

Figure 3 is intended to represent the stationary framework, being a detail of a part of Figure 1, built in uprights, of piles, driven into position in pairs and stiffened by horizontal timbers, the idea being to make it a part of a pier, breakwater or wharf.

The general scheme of utilizing wave power has been tried again and again; it has never been wholly satisfactory; something usually breaks down, or gives out, and the wave force that is relied upon to give efficiency to the whole thing generally breaks some of the apparatus when sufficiently forcible to have any effect at all. That wave power may some day solve the problem of cheap power is possible; that the apparatus here briefly outlined will do it does not appear probable. At present it is but a curiosity. A model of the air compressor is on exhibition at 602 Market street, this city. The projectors have incorporated and say that with $25,000 a 500 H. P. section of air pumps can be built. Their plan of raising that amount is to have the public subscribe a first payment of ten cents per share on 250,000 shares of stock, which plan appears devoid of originality.

This is as much as can at present be said of this latest phase of a philosophical proposition. The projectors expect to be able to overcome all present objections to its practicability.

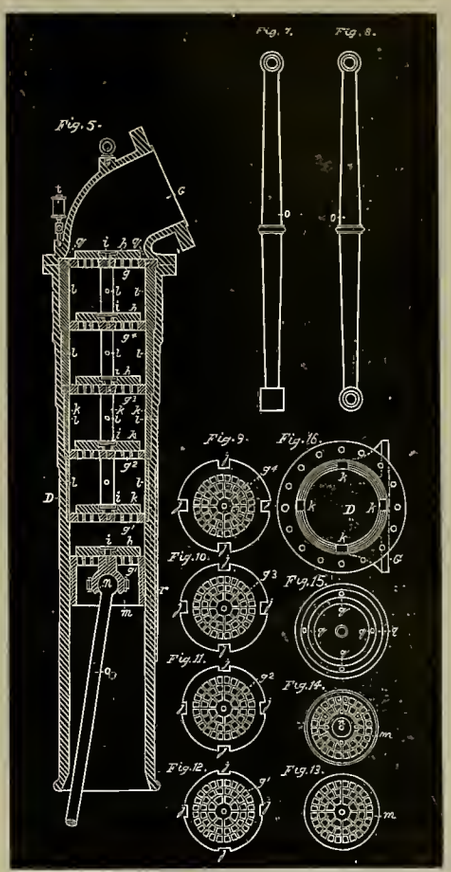

FIG. 2.—LONGITUDINAL SECTION THROUGH PUMP.

On page 388 appears the latest utterance regarding the selective action of cyanide. Meanwhile, the call for cyanide rings round the world, and despite the numerous published objections to the McArthur-Forrest patent and its workings, that company can answer by citing South African results.

"Light as air" is a common simile, yet under certain conditions air is heavy. Compressed to the degree noted on another page, at the Fort Point pneumatic battery, overlooking San Francisco harbor, a cubic foot of air weighs ten pounds. Ordinarily, at 50° Fahr., a cubic foot weighs 536 grains.

Prominent among the causes of the increased activity in gold mining, apart from the slump in silver and the hard times in other lines, is the fact that, as compared with twenty years ago, forty per cent more gold can be extracted from the same ore at thirty per cent less cost.

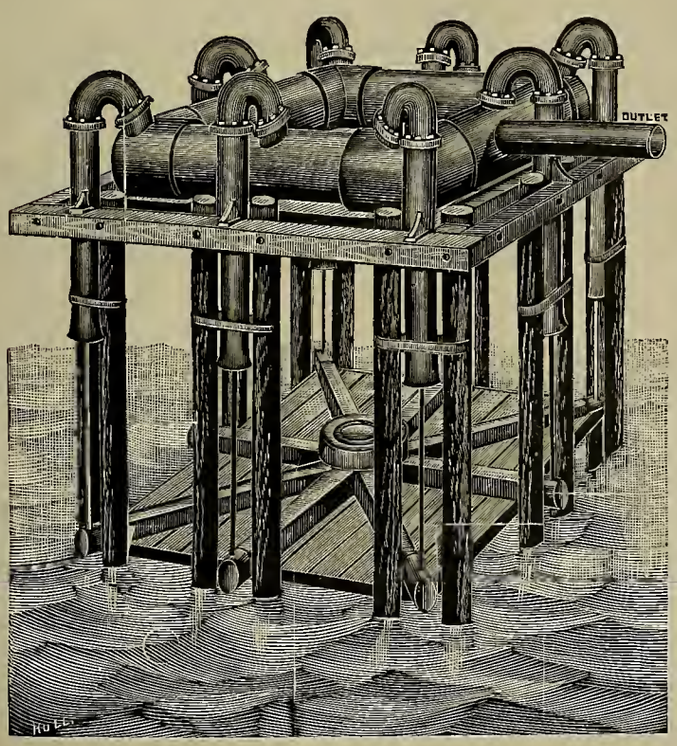

FIG. 1.—PERSPECTIVE OF EIGHT AIR PUMPS.

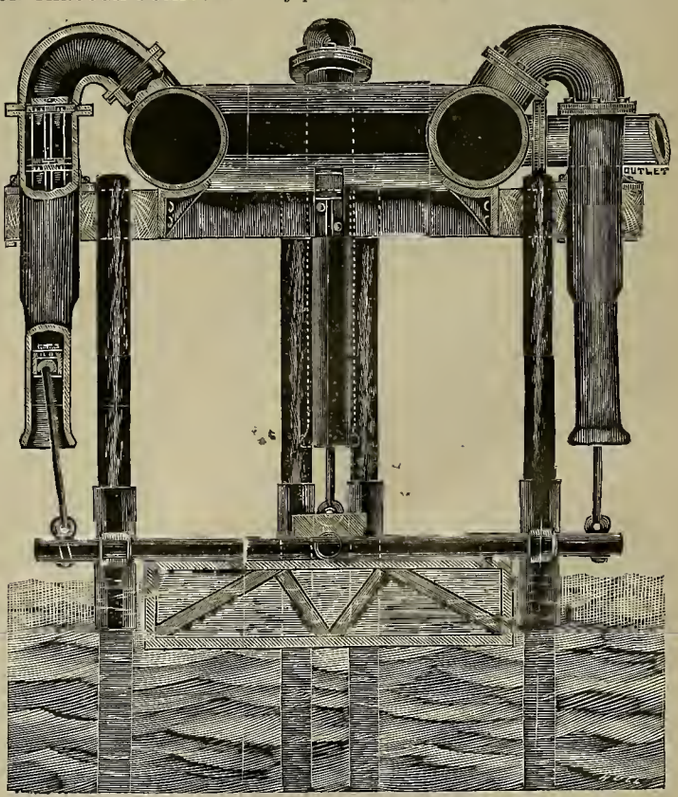

FIG. 3.—THE STATIONARY FRAMEWORK.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Power From Ocean Waves—Fig. 1. Perspective of Eight Air Pumps; Fig. 2. Longitudinal Section Through Pump; Fig. 3. The Stationary Framework, 385. Bennett Amalgamator Operated by Electric Motors, 392.

EDITORIAL.—Power from Ocean Waves; The Selective Action of Cyanide; Weight of Air; Causes of the Increased Activity in Gold Mining, 385. Deserved Commendation; Chemical Works, etc., at Deadwood, S. D.; Curious Sidelight on Some Conditions of Some Business; Good Work of the Arizona *Journal-Miner;* Advantages of Holding a National Nominating Convention Here; Mining Items; Domain Under Control of the South Africa Company; Meeting of Executive Committee of California Miners' Association; Location Notices; Applications for Permission to Work Hydraulic Mines; The Most Effective Protective Battery, 392.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 390-91.

ELECTRICAL PROGRESS.—Amalgamator Operated by Electric Motors; Electrically Lighting Railroad Trains; A New Electric Drill; Metallic Specks in the Eye; Western Electric Company vs. Capitol Telephone and Telegraph Company; Triple Expansion Engines for the New Parrott Building; Large Amount of Copper Wire, 392.

SCIENTIFIC PROGRESS.—Recent Chemical Achievements; Measuring Wind; An Improved Theodolite; Liquid Air; Chalk Slabs; "The Autocar," 393.

MECHANICAL PROGRESS.—Horseless Carriages; The Fort Point Batteries; Solidifying Petroleum; Award by the Russian Government, 393.

PRACTICAL INFORMATION.—The Commercial Micas; Very Old Maps; Circulation of the Blood; "Steeled Iron;" Weight of Ships, 393.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 398.

MISCELLANEOUS.—Concentrates, 387. "On the So-called 'Selective Action,'" 388. Notes on Gold Milling in California; Failure of Aluminum Torpedo Boat, 389. Coast Industrial Notes; Personal; Notices of Recent Patents; Books Received; New Catalogues, 391. Production in 1895, 392.

DESERVED commendation is given State Mineralogist Crawford for the admirably arranged statistical table by counties of the mineral product of the State for '94. The only improvement that could be suggested would he to get it out earlier in the year, but that is a matter largely in the hands of the State Printer.

DEADWOOD, S. D., is figuring on chemical works for the manufacture of chlorine and sulphuric acid. It is estimated there that sulphuric acid can be produced for $10 per ton, and chloride of lime $17 per ton. The *Review* reports the use of the chloriuation method greatly on the increase iu the treatment of the silicious gold ore of that section.

A CURIOUS sidelight is thrown on some conditions of some business in the quoted statement of an Eastern bicycle manufacturer that a wheel retailiug at $105 cost $27 at the factory; $30 to advertise it and $35 agent's commissiou, leaving $13 unaccounted for. The statement that it costs more to advertise a bicycle than to market it seems, however, to he an exaggeration.

THE Arizona *Journal-Miner*, published at Prescott, is doing good work for the mining industry of that section, by promptly exposing efforts to place mining property of douhtful value on inflated capitalization. Iu comment on one of the more recent of such efforts, it says: "Yavapai county has seen too many mouuments of failure erected on good meritorious properties, through mismanagement, stock-jobbing schemes and other causes, for her citizens to countenance and indorse anything that carries the impress of fraud on its face."

IT would be an advautage to miuers to have a uational uominating convention hold its session here, as that would be an opportunity to discuss this mineral land question at shorter range. One great trouble in having justice or equity in this matter is the inability of those who have the decision thereon to act understandingly. The most recent exhibition of lack of knowledge in this regard is the decision on petroleum lands in this State. Because petroleum is classed as a mineral land, and because mineral lands are daily patented as agricultural land, forms no reason for continued misrulings on those lands. As in the case of mineral—that is, metal-bearing land—oil lands should he withheld from agricultural entry. The hurden of proof should he on the agricultural claimant. To explain this across the coutinent is a difficult task. In this respect an occidental trip of a government land official, present or prospective, would be an important part of a liberal education.

THE origiu of mining items and their appropriation without credit is the subject of complaining comment from nearly every mining journal in the country. Experience and observation lead to the belief that the chief cause for such wholesale disregard of courtesy in this matter is that after any one has seen what he secured hy effort and expense appropriated without credit, he concludes after some time that he will do the same. Of course, this is not defensible, nor excusable, hut is a probable reason. These remarks are partly elicited by a Grant's Pass, Oregon, mining paper which complains that a recent item in an Oregon decision affecting the right to mine gravel bars first appeared in its columns, was then copied without credit hy the *Oregonian*, published at Portland, Or., and after more reproduction "found its way into the MINING AND SCIENTIFIC PRESS, its paternity still ignored." We would have been pleased to ascribe the proper paternity to the item in question, hut were unacquainted with its source. In a condeused form the gist of the matter appeared in "Conceutrates" as something worth attention. Its publication induced a communication (published on page 359 of the issue of Nov. 30th) which, it is helieved, will result in benefit to the mining industry of Oregon, and the correction of a prevalent abuse. Not until it was noticed in a journal of the circulation aud standiug of this one did the matter receive any attention. Meanwhile, if the Oregon mining journal originated the article that formed the basis of the few lines accorded the subject in "Concentrates," it certainly deserves all due credit therefor. "Crediting" matter is sometimes difficult, even where the desire to he just exists. Nearly every line in this paper is reproduced in other papers, yet hardly one-tenth of it is ever "credited" to its original source. This is not said in any spirit of criticism nor complaiut, hut is a simple assertion of existing fact. Any one and every one is of course welcome to copy, with or without credit, but good intent to indicate the original source is often thwarted. A case in point which illustrates our meaniug is furnished hy the *Sierra County Advocate*, published at Hillsboro, New Mexico. In its issue of the 6th inst. appear eleven "items" which were originally published in this paper. Ten of them are credited to a Denver mining paper. The Hillsboro, N. M., man douhtless desired to give credit, and naturally credited the paper in which he first saw the matter published. In this he differed from his Denver coutemporary. The general benefit to the mining industry resulting from accurate and reliable statements justifies their widest reproduction, adding to the common stock of knowledge; and while, of course, any one and every one likes to receive recognition, yet failure to duly credit should arouse no feeling of resentment, though it must be confessed it is often extremely annoying to see an article that cost time and money coolly appropriated without a word of credit; and when others recognize its value and republish it, credit the publication that chanced to first reproduce it, completely ignoring the journal that originated the matter.

BIGGER thau Belgium, of greater extent thau the province of Lorraiue, is the area in this State owned by one cattle firm; yet great as is that aggregation of millions of acres, in private ownership it is exceeded in extent and value hy the great South Africa Company, which owns a nation, deals with a continent, makes war, goverus, concludes treaties and exercises many of the rights usually associated with practical ownership. Cecil Rhodes and associates have temporary control of African territory of an extent equaling France, Germany, Austria and Italy combined—an area five times that of California. The company recently concluded a war in Matabelelaud, which was an incidental occurrence, a mere circumstance. Its greatest husiness is grantiug mining licenses: it does no mining itself, hut issues permits to other companies to mine in its territory, taking as rental 50 per cent of the vendor's share of the mining company's stock. It combines profit and patriotism and is in exact accord with British aggressiveness in Venezuela, Alaska aud other gold producing localities. So far it has spent £5,000,000 more than it has received, and will spend as much more, confident of gigantic profits later on. Under its auspices nearly three hundred prospecting companies have been formed; and should the prophesied extensive gold deposits be found scattered through "Rhodesia," the revenues will be great. In any event, the company's stockholders can so arrange as to offset any probable loss hy ulterior profit. In connection with gold mining, it is the most stupendous scheme of the century; like similar enterprises, it has the same relation to legitimate gold mining.

AT a meeting of the executive committee of the California Miners' Association at the Union League Club rooms in this city last Thursday night, hy an almost unanimous vote of those present a bill was endorsed to he presented to Congress "to provide for ascertaining aud determining the character of certain lands in the State of California." The hill as adopted is satisfactory to the S. P. Co. The original idea or intent was to present to Congress a hill similar to the Idaho-Montana bill, providing for the protection of mineral lands, hut in the judgment of the gentlemen present last Thursday night it was deemed advisable to adopt another measure. The hill adopted hy the committee will not suit the miners and does not meet the requirements of the occasion. Were it to pass and its provisions carried out, it would fail to be of material benefit iu the protection of the mineral lands from corporate effort to absorb them. The result is a disappointment to many who had hoped for a more satisfactory determination of this important question.

THE Secretary of the Interior, in a Montana case, decides that strict compliance must he made with the requiremeuts in making a location that the notices must he posted "in a conspicuous place." Because of their failure to prove that such notices were so placed three Butte locators have lost their claims, Secretary Smith reversing the finding of General Land Office Commissioner Lamoreux and sustaining the decision of the Helena land office. In extended comment the Secretary of the Interior lays great stress on the requirement that notices must be conspicuously placed, hut confesses inability to make a general rule as to how "a conspicuous place on a mining claim" can he defined. In the particular cases cited the evidence showed that none of the uotices were posted at any of the discovery shafts, nor near either of two traveled roads.

APPLICATIONS are still heing made for permissiou to work hydraulic mines in this State, twelve such applications being advertised in this issue. The hundred or more companies and individuals who have secured such permission have nearly all gone actively to work, the result being noticeable in the increased receipts of gold here. A very small percentage of those working hydraulic mines under the Caminetti act have neglected to keep their impounding works in proper condition, and their mines have been promptly closed down by the field assistants of the Debris Commission, who are constantly traveling round to see that the requirements have all been complied with. The commission is strict, but it is right, and the only complaint comes from the anti-debris people, who would complain still more were there really anything to justify objection.

IF, as some of our belligerent brethren declare, this country is "on the eve of a great foreign war," it is satisfactory to know that San Francisco has the most effective protective hattery in the country. Its successful trial this week demonstrated its superior efficiency, and insures its acceptance hy the Government. The air compressing machinery which furnishes the power was constructed by the Fulton Eugineering aud Shipbuilding Works of this city, which designed and built them under a competitive contract. It is the opinion of those most competent to form judgment that the dynamite battery at the entrance to this harbor can successfully defend this city from the hostile approach of any warship.

Concentrates.

MINERS at Mercur, Utah, have organized a union.

"THE VIRGINIA CITY OF CALIFORNIA" is the term now locally applied to Coulterville.

THE Silver King, Utah, mine paid a $37,500 dividend last Saturday, making $450,000 to date.

IN Chicago it is proposed to have 100 men each put up $1000 to form a Mining Exchange "on a solid basis."

AN electric light plant is to be put in by Supt. Marcom of the Crnnde Ronde Mining Co. nt La Grande, Or.

GEORGE C. CAYLORD of Nevada City has bonded the Canada Hill Consolidated, and now controls tbat entire property.

THE company operating the Tulloch mine, Calaveras Co., bas been incorporated under the name of the Godbe Company.

NEVADA'S mines have produced over $600,000,000 in gold and silver, and as much more there awaits development and production.

A SOUTH AFRICAN mining engineer writes that the average gold extraction there is about 80 per cent of the assay value of the ore.

PLANS were prepared tbis week for the Morgan Mining Co., Park City, Utah, which is going to put in an entire new hoisting plant.

THE Northwestern Mining Association is to have an organ, a monthly magazine, entitled *Mining*, to be published at Spokane, Wash.

THE Victor Gold Mining Co., one of the steady producers of the Cripple Creek district, paid its usual monthly dividend of $20,000 last Tuesday.

NEAR Baker City, Or., the Bonanza mine produced $10,000 in November. Supt. Geiser says ten stamps will be added to tbe ten now at work.

EXCELLENT REPORTS continue to come from the Niagara mine, Sbasta Co. The lessees are making considerable money and the outlook is promising.

CAPT. COUCH, general manager of tbe Merced G. M. Co.'s operations in Mariposa, is nominated for Goveruor of Montana by the Butte *Mining and Railway Review*.

NEARLY all the idle men of Carson, Nevada, are reported to have work by the opening up of the Buckeye placer work. More men will be needed there next spring.

A PARIS mining syndicate wbich has bought some good properties near Bacoachi, Mexico, has decided to build a railroad to their mines from "Station 30," near Bisbee, Arizona.

A MINING CLAIM is not legally "known to exist" from the location thereof if the boundaries of the claim are not specifically marked on the ground and due notice of tbe location given.

WHEN a legal location of a mining claim has been made on land returned as agricultural, the return of tbe surveyor general is overcome and the burden of proof shifts to the party attacking the mining claim.

A NOTICEABLE difference between Idaho and Nevada mines is that on the latter the deeper the mine the greater the percentage of silver in the ore; in the former, the farther down the greater tbe gold percentage.

ARIZONA'S deepest shaft—1415 feet—is at the Congress mine, where nearly 400 men and a 40-stamp mill work continually. As at Keswick, in this State, no saloon is allowed within the limits of the company's property.

NEAR Bolinas, Marin Co., a two-foot copper ledge has yielded about forty tons, worth $45 per ton, which will be sent to Selby's. The expectation is that between Mt. Tamalpais and tbe ocean considerable copper will be found.

IN the Prescott, Arizona, District Court in the suit brought by C. W. Henry for the recovery of $150,000, claimed to have been expended by bim in the Henrietta mine under fraudulent representations, tbe jury has found for the defendant.

DURING November the Tacoma smelter produced 3200 bars bullion, weighing 327,983 lbs., containing: 1,175.58 ozs. gold, at $20.67, $24,299.24; 27,090.37 ozs. silver, at 67 cents, $18,150.55; 326,026 lbs. lead, at $3.20, $10,432.83; total, $52,882.62.

THE last issue of the Okanogan, Wash., *Outlook*, which formerly was filled with mining news, does not give one item regarding development in that region, or wbat is being done with mining properties that used to employ large numbers of men.

C. T. BANDMANN, former superintendent of the Pittsburg mine, tells the Crass Valley *Tidings* that there are good prospects that the Pittsburg will soon he sold to an English company, and that energetic work will be done on the property by next spring.

SOME Oregon journals think the gold statistics of tbat State recently published were too bigh for Union, Josephine and Baker counties. Exact data is bard to secure, but it is believed that the amounts given were in approximate accordance witb the facts.

THE Nelson, B. C., *Tribune* declares the following is a sample of the letters it receives from subscribers: "DEAR SIRS:—I am not dead, but am at work. My subscription has run out, but don't stop the paper. As soon as there is enough snow to rawhide ore I will makc a shipment, then pay up."

A KERN COUNTY man, T. A. Wells, visiting Coler, says: "Tbere are a number of peaks of quartz all the way from ten to twenty feet higb, and the rock pans $200 a ton. The claims appear to be a whole mountain of glittering wealth. At the foot of this mountain dry washers are making $10 a day, bandling tbe dirt tbat bas wasbed down from it. Tbe firm has been offered $80,000 for one of the smaller claims." That sounds wealthy, but it is a mistake to give such stories credence. There are some good prospects there, but such manifest exaggerations will not help that district, nor any district.

THE Lo Grande Oro placers at Silver City, Nev., are reported panning out $2 to the cubic yard. Experts say that the channel has carried the wash of the gold end of the Comstock for centuries and has been overlooked until recently. About forty men are now at work for the company.

MEN with new ideas about gold saving machines will find opportunity to exercise their ingenuity in the new claims located as placer near Johntown, Nevnda. The gold is exceedingly fine, mixed with much black sand and round iron stones from the size of a small shot to fifty pounds in weight.

THE Idaho State University at Moscow has established a department of mining, to teach men how to test ores so they can judge whether they have mines worth developing. There is no charge, except for materials used, which amounts to about $5 per month, and living expenses, $3.50 per week.

THE Secretary of the Interior has just decided that "a mineral entry cannot be allowed where the applicant fails to post the plat and notice of application in a 'conspicuous' place on the claim, and failure to comply with the statute in such particular will make new notice of the application necessary."

THE injunction of the Argonaut on the Kennedy Mining Company restrains it from taking ore from tbe land in dispute between the two mines until the suit now pending between the companies is decided by the court, but does not interfere with the work in any other part of the mine. The report that the mine has been sbut down is not correct.

DISCOURSING on Kaffir stock, the London *Statist* declares that the slump is stopped; that it will do good all round to bave some of the water squeezed out, and that the annual Rand gold output will increase from $40,000,000 to $100,000,000. Tbat, with Californiа, Australia et al., ought to produce enough "sound money" to satisfy even Clevelaud, Benedict and Carlisle.

THE first of the deep shafts to reach the ore at Johannesburg is the Celdenhuis Deep Level, which cut the conglomerate blanket at about 2500 feet. Tbe result did not come up to anticipations, but it is thought will sbow better when the plates are not so new. The Celdenhuis company has under construction a 200-stamp mill, and cyanide works for the treatment of tailings.

THE Canadian Government has let a contract for the carrying of mails from Juneau, in Alaska, to Forty Mile Creek, wbicb is also in the territory always claimed by the United States, but which Canada is now asserting a claim to. For a foreign country to let a contract for the transmission of mails in the territory of another Covernment is something unusual in international affairs.

AN Amador county prospector writes: "I am down in a shaft, rigbt on a ledge of quartz, only twenty feet, and the water is so bad I cannot go down any fartber. There are abont four buckets of water to one of rock. Can I make a syphon work?" If conditions are favorable a syphon will do till a depth of thirty feet is reacbed. Tbat is about the limit. If he intends going deeper a pump would be required.

WM. CHALMERS, of Fraser & Chalmers, Chicago, who has returned from South Africa, says: "The situation as regards the ownership of the mines and the present boom in Kaffirs may be summed up tbus: The English own the mines, the Americans manage tbem and the French and Germans are permitted to speculate in less than half of the stocks—less than half, observe, because the English are not going to relinquish the majority holdings at any price."

FROM W. P. Prisk, the enterprising proprietor of the Crass Valley *Union*, is received tbe *Nevada County Mining Review*, typographically superb and statistically valuable, giving favorable and authentic mention to the mines and miners of a county tbat has produced $75,000,000 from its quartz and $125,000,000 from its placer gold mines. No one who never tried it can appreciate the effort required to bring to a successful issue snch a publication as tbose bandsome 150 pages.

THE Butte *Inter-Mountain* compresses a column into seventy words, as follows: Cold mining, or in fact any other kind of mining, is now a highly scientific industry demanding capital and skill. A rich ore is by no means synonomous with large profits. Tbe presence of gold is a necessary element of success, but equally essential elements are tbe tractable character of the ore, tbe situation of the mine and the fuel and water supply. The problem is purely a commercial one.

SECRETARY OF THE INTERIOR SMITH has ordered the Commissioner of the General Land Office to suspend the furnishing of lists of selected lands for the Union Pacific and Central Pacific railroads to the Interior Department, which virtually stops operations in that office regarding the obtaining of patents on lands granted to these railways. The railroad companies bave been paid for most of the lands, but while the settlers have made their improvements thereon, they cannot get titles.

THEODORE FOX, in his suit for $1,500,000 against tbe Con. Cal. and Va. M. Co., the Comstock M. and M. Co., Jno. W. Mackay and Jno. P. Jones, was beaten in Judge Seawell's court in tbis city last Monday, judgment heing entered for the defendants. In another suit brought by the same plaintiff, questioning the right of tbe Con. Cal. and Va. mine directors to pay $50,000 to Supt. Patton as reward for services in putting out a fire in the lower levels of the mine, the court also found for tbe defendants.

CONTRARY to the usual wind-up of letters announcing "rich strikes," but concluding by warning all miners to stay away, "as there are more men here now than can find employment," F. J. Kelley of Bland, New Mexico, says that "tbe camp has 500 miners in it and not an idle one among tbem; that the wages are $3.50 per day, and tbat they cannot get enougb miners to do tbe work, and that if miners would come to that section they would find immediate employment." It is possible, but by no means probable, that the statement is so.

THE *Tribune* reports Manager Goss of the Cood Hope placer bas constructed a current wheel, tbirty-three feet in diameter, that will derive its power from tbe Colorado river. To the paddles of tbe wheel are attached buckets tbat dip and rise and dump tbeir contents at the rate of 125 miners' inches a minute, witb whicb be expects to bandle 1000 yards of gravel every twenty-four hours. "For years the threshing of the sands against the stupendous walls at Good Hope has created a measureless bar of auriferous concentrates that vary in their values from 80 cents to $3 a ton."

THE arrival of President Leonard of the Comstock Tunnel Co. on the Comstock is interpreted by the *Enterprise* to mean that the tunnel is to be extended to the Rock Island and West Point mines. There are two points where this extension might connect with the tunnel—in the Alta mine or in the Crown Point. By the former route the American Flat country would be accessible; by the Crown Point the tunnel would pass through an entirely new section that has been sufficiently prospected to proclaim its value, but is undeveloped.

IN the case of Hoskins vs. Curran, tho Idaho Supreme Court this week made a decision of interest to miners in that State. It virtually precludes the bonding of mining property in that State, or the execution of the bond for the deed. Tbe decision in effect is tbat a bond for a deed may be set up as a counter claim, which is probably the same as saying that the bond for a deed may be the subject of original action, even when the terms of the bond have not been complied with, and, by the ordinary wording of tbe bond, is void for noncompliance. The decisiou will result in the placing of deeds in escrow instead of executing bonds for deeds.

THE San Francisco Gold Mining Company has incorporated to develop the Golden Contact and Colden Circle claims in Cripple Creek mining district, El Paso Co., Col. The directors are: T. B. Everett, Denver, Col.; T. J. Parsons, C. W. Root, S. W. Backus, W. C. Ralston, G. Stone and F. W. Hinckley of this city. Capital stock, $500,000, fully subscribed, as follows: T. B. Everett, $100,000; T. J. Parsons, C. W. Root, S. W. Backus, W. C. Ralston, J. H. Neff, T. J. Nichols, J. Sonntag, B. T. Smitb, J. M. Miner, T. Flint Jr., $20,000 each; J. B. Fuller, P. Kilburn, $10,000; F. W. Hinckley, $30,000; C. St. Clair, $40,000; G. Stone, $110,000.

SINCE June 20, '92, the Colville Indian reservation has been opeu to mineral locations, and prospectors and mining men have neglected their opportunities only because tbey did not understand the law. That is the legal opinion of several attorneys who have given the matter mucb investigation, and, acting upon it, men have been prospecting for months on the reservation, and as a result of their discoveries have staked out their claims and had them recorded in the office of the Stevens county auditor nt Colville, Wash. It is said by well-informed persons that more tban forty such claims have been recorded already, and that tbese cover the pick of tbe mineral ledges crossing the liue from the Trail Creek district.

IN his introduction to Messrs. Hatch & Chalmers' work on "The Gold Mines of tbe Rand," John Hays Hammond makes the following remarks, which are approvingly quoted by all who believe in the deep level theory of Rand gold mining: "The feasibility of successful mining upon the area comprised by the outcrop and first row of deep-level mining companies is practically assured. It is to the mining of the deeper areas embraced within the second row of deep-level claims tbat I confine my remarks. Tbe problem is one of great importance, not only to the Transvaal, but to the world in general, for on its successful solution depends the gain to the world of an enormous gold output, as appears, if we accept the conservative estimate of £52,000 as the yield in gold per claim. Upon this basis it will be seen that every 1000 feet of vertical length, assuming the reef to be 36° in its dip, would open up ore from which £260,000 of gold would be obtained for every 150 feet, the length of one claim along tbe course of tbe reef. Every mile of ground parallel to the course of the reefs would therefore yield per 1000 feet of vertical depth the sum of about £9,000,000. The problem presented, then, is to how many thousands of feet in deptb can mining operations be carried in the Witwatersrand mining district? From an engineering point of view, mining operations are certainly practicable to a vertical depth of at least 5000 feet. Tbere is no necessity for abstract reasoning upon this point, as the practicability of miuing to these depths has been demonstrated in other countries. But, regarded from n financial point of view, will mining to this depth pay? The initial expense, as compared with that of mining upon tbe outcrop companies, will undoubtedly be considerably greater, on account of the increased cost of the heavier plant required and of the shaft sinking involved; therefore, it will be necessary in order to insure profitable mining upon such deep-level properties tbat larger areas be embraced in one company, so as to minimize the capital of expenditure per claim worked. If we work, for example, by means of deep-level plants blocks of 250 claims to the depth of 5000 feet, the extra cost per claim, as compared with the cost of the plants to work the outcrop companies, will not be more tban £1500 a claim, surely not a prohibitive expenditure if we bear in mind the fact that the profits per claim upon the central section are estimated at upwards of £18,000. As a matter of faet, the capital expenditure through faulty engineering in the case of the outcrop companies bas been considerably greater tban tbe estimate I bave allowed in this comparison of the relative costs of mining the outcrop and deep-level companies respectively. Tbe cost of mining would likewise undoubtedly increase compared with tbat of the most economically managed of the outcrop companies; but in my judgment these increased expenses would not, even under present economic conditions, greatly exceed those of tbe average mining costs of the outcrop companies. Tbe increased cost would be due chiefly to tbe larger expenses attending hauling, pumping and ventilation; but even under present conditions as to cost of labor and supplies the extra costs of deep-level mining to a depth of 5000 feet should not exceed 5s per ton; and tbis is obviously an insuperable obstacle to profitable mining. In my opinion there will be even less disparity of eost than this, owing to improved economies that would be effected by conducting the operations upon a larger scale than customary, by obtaining cheaper, or, in any event, wbat is equivalent, more efficient labor, both white and black, and by cheaper supplies. Therefore, looking to the time wben deep-level mining will be carried on extensively, we may reasonably predict sucb betterment of the economic conditions as to admit the mining of ore at the same working costs per ton as now obtain in the outcrop companies. Tbe successful working of these deep-level areas presupposes the persistency of the conditions of the blanket formation as to the widths and gold contents of the reefs. That such conditions obtain is evidenced by the geological character of the formation, and confirmed by the facts elicited tbrougb the actual workings upon tbe first row of deep-level claims, also from the deep-level boreholes."

"On the So-Called 'Selective Action'

Of Very Dilute Solutions of Cyanide of Potassium Used in Obtaining Gold and Silver from Ores and Other Compounds."*

By JAMES MACTEAR.

It has been stated in one of the MacArthur-Forrest patents that "in practice we find the best results are obtained with a very dilute solution, or a solution containing or yielding an extremely small quantity of cyanogen or a cyanide, such dilute solution having a selective action such as to dissolve the gold or silver in preference to the baser metals."

To most of those who have been engaged in investigating this process, or who have followed the recent litigation, the precise meaning of this assertion has been somewhat of a difficulty, the only definite explanation of which so far given has been the statement in the judgment of the Court of Appeals, here given verbatim that "a strong solution attacks the baser metals without attackiug the gold, whereas a weak solutiou is feeble and nil on the baser metals, but attacks the gold."

This, no doubt, seems to be a very definite assertion, but when one begins to examine the actual facts it is seen to be incorrect. As a matter of fact, no statement has ever yet been made—and supported by experiments—to prove that a strong solution "attacks the baser metals without attacking the gold," nor that the action of "a weak solution is feeble and nil on the baser metals, but attacks the gold."

The strongest claim that has yet been made and supported by experiment is uot that indicated hy the above quotation from the judgmeut in the Court of Appeals; but only that, as a general rule, a strong solution while dissolving the gold will also dissolve the baser metals, and that a weak solution in dissolving the gold will also dissolve the baser metals—iu both cases a much larger actual weight of base metal than of gold being dissolved, but in the case of the weak solution less base metal in proportion to the gold is dissolved than is the case with the strong solution—the ore submitted to the solutions, and the length of time during which the action of the solution upon the ore is allowed to continue, being the same in both cases.

It has been ingeniously argued, on the other hand, that while the "selective actiou" mentioned in the patent does not mean that strong solutions do not dissolve the gold, but dissolve the baser metals, and that weak solutions do dissolve the gold and uot the baser metals, it does mean that the proportion of gold to base metal found in the solution is generally much larger in the case of dilute solutions than it is in the case of strong solutious as used in the treatment of ores, and, therefore, the result is that a greater concentration of the gold is obtained by the use of dilute solutions.

In discussing the question it is necessary to bear in mind the fact that two types of action are involved. Firstly, the actiou of chemical affinity (a term most of us will be quite satisfied to use, although advanced chemists may consider it obsolete, as it is a convenient expression to explain certain chemical facts), and secondly, the action of such chemical affinity assisted or modified by an electric current.

Before dealing with these separately, it will be necessary to define what is meant hy the term used in the patent specification, "the haser metals."

It may be accepted that this term refers not to the baser metals in their metallic form, but in the form of their natural compounds as they are generally found associated with gold and silver in their ores. Were it otherwise, and the baser metals in their metallic form were meaut, then it is evident that the "selective action," as defined in the Court of Appeals, has no existence as regards the metals, but that the action is simply one of chemical affinity where the particles of metal are so placed in the solution that they do not form an electric couple. In other words, that the actiou is simply that of the cyanide solution upon the metals.

Experiments on the effect of cyanide of potassium solution on plates of the metals were made by Dr. Gore, aud the results of such experiments, with a solution containing 1.86 per cent of cyanide of potassium, equal to 0.74 per cent of cyanogen (within the limits given of very dilute solutions in the MacArthur-Forrest pateut, at 60° Fahr.), were published in the proceedings of the Royal Society, vol. 37, p. 284.

The table there given shows the absolute proportionate weight of the various metals dissolved or "corroded" from one square inch of surface in one hour. Taking the amouut of gold dissolved as 100 parts, the following are the proportions for the metals named:

Aluminum	1055
Zinc	600
Copper	588
Silver	177
Gold	100
Tin	66
Nickel	55
Iron	Trace
Platinum	Trace

It will be seen at a glance that gold is iu the middle of the table, and that aluminum, zinc, copper and silver are more readily soluble, or, in other words, the "selective action," so far as these metals are concerned, is in their favor, and against gold; while tin, nickel, iron and platinum are all less soluble, and as regards these metals the "selective action" will be in favor of gold.

Of all these metals, silver and copper alone may be considered as existing naturally in the metallic state in gold ores in appreciable quantity, and both of these are shown by the table to be more readily soluble than gold, and so far, therefore, the "selective action" of dilute cyanide solutions upon gold and the baser metals, where the action is not assisted by an electric current, may be dismissed without further consideration.

It is a very different matter, however, if we accept the wider interpretation of the term "the baser metals," and take it to mean the uatural compouuds of the baser metals as they are found with gold and silver in ores. In this class will fall to be included such compounds as the oxides, carbonates, chlorides, sulphides, and sulphates of the baser metals.

We may assume that the compounds of the baser metals which are to be found in the gold and silver ores are chiefly those of iron, zinc, copper and lead. These are the only ones which may be considered as practically affecting the question of "selective action" in the treatment of ores.

Dealing with these in their order, experiment has shown that the action of cyanide of potassium solution on freshly precipitated oxides of irou, zinc, copper and lead is much greater than it is upon gold. As an illustration of this, equal quantities of freshly prepared oxides, precipitated from the sulphates, were treated with cyanide of potassium solution, of varying degrees of concentration, for 24 hours, in the preseuce of very finely divided metallic gold. The strength of solutions employed was:

	I.	*II.*	*III.*
Cyanide of potassium in 1000 parts of solution..	5	20	50
EQUAL TO			
Cyanogen in 1000 parts of solution	2	8	20
Proportion of gold dissolved (No. 1 taken as 100)	100	237	550
Proportion of base metal oxides dissolved	100	100	100

It will be observed that the proportion of base metal oxide remained constant for each of the three strengths of solution, the explanation of this fact being that the whole of the oxides were dissolved in each case, while the proportion of gold dissolved by the solutions increased with the strength of the solntion, the whole of the gold, however, not being dissolved even in the case of the strongest solutiou.

The relative proportions of base metal oxide to gold dissolved in this experiment were:

	I.	*II.*	*III.*
Gold dissolved (taken as 100)	100	100	100
Base metal oxides dissolved	1,920	650	281

It is evident that in this case the base metal oxides (freshly prepared) were much more soluble than the gold in the dilute solution, and that such "selective action" as existed was in direct variance with that claimed for the dilute solutions iu the MacArthur-Forrest patent.

It may be argued that an experiment with freshly prepared base metal oxides does not fairly represent the condition in which the ores are usually found in nature. This is so far true, but in the carrying out of the process in practice, in many cases the treatment of the ores with alkaline solutions has the effect of producing hydrated oxides which are readily dissolved by cyanide of potassium, as in the above experiment.

It is true that in the case of some of the native oxides the rate of solution hy cyanide of potassium is very much slower; for instance, in the case of a very rich gold ore containing over 21 ounces of gold to the ton, and iron, in the state of oxides, =1.202 per cent.

It was found that by treating the powdered ore with a solution containing 1.22 per cent of cyanide of potassium (equal to 0.49 per cent of cyanogen) for 24 hours, the quantity of the solntion being equal to half the weight of the ore, the amounts dissolved were:

	Ozs.	*Dwts.*	*Grs.*
Gold	7	0	22
Iron, calculated as ferrous oxide	7	1	12

Showing practically the same amount of gold and ferrous oxide dissolved in 24 hours.

There is little doubt that had the relative amounts of gold and ferrous oxides dissolved been determined after the treatment of the solution had continued for (say) 6, 12 and 18 hours, it would have been found that the proportion of ferrous oxide to gold was greater for the shorter period.

In the case of carbonates of iron, copper, zinc and lead, the amount of such carbouates dissolved by a dilute as well as by a strong solution of cyanide of potassium is very much greater than that of the gold or silver present with them, all the more so if oxygen be absent, and the "secretive" or "discriminating" action is entirely the reverse of that mentioned in the patent.

As regards the chlorides, the presence of any appreciable quantity of base metal chlorides in gold ores is so rare that it may be neglected, but should chloride of silver be present, it is dissolved much more readily than the metallic gold.

The base metal compounds most commonly met with in gold ores are the sulphides of iron, copper, lead and zinc, in the form of iron and copper pyrites, galena and zinc blende. In the case of these sulphides, very considerable differences are met with in regard to the rate at which they are dissolved, their physical condition as well as their chemical composition affecting the action of the solution of cyanide of potassium upon them. Whatever the strength of the solution, its action is complicated by the presence of alkali as caustic or carhonate of potash, either present originally in the solution, or produced in it by the reactions taking place in the process. This alkali acts on the sulphide in certain cases, complicating the reactious, but experiment shows that as a general rule the amount of base metal dissolved is much greater than the gold or silver dissolved, even where oxygen is present. Thus, in the case of clean unoxidized iron pyrites contaiuing gold equal to 11 dwts. 10 grains per ton, the finely powdered ore was treated with half its weight of a solution containing 1.22 per cent cyanide of potassium (equal to 0.49 per cent cyanogen) for a period of 24 hours. The relative amounts of gold and based metal sulphide dissolved were:

	Ozs.	*Dwts.*	*Grs.*
Gold	0	8	14
Iron as FeS_2	41	13	0

The percentage extraction of the gold being equal to 75.6 per cent, while 78.7 per cent of the cyanogen had been used up.

In the case of oxidized ores we have to deal with base metal compounds in the form of sulphates, nearly all of which are soluhle in water. So far as regards these soluble sulphates, it requires no experiment to prove that there can be no "selective action" in favor of gold when a dilute solution is used in a case where even water will dissolve the base metal sulphates without dissolving the gold.

The presence of alkali in the solution also sheets the result, as the soluhle sulphates are decomposed with the formation of carbonates or oxides of the baser metals, which are acted upon hy the cyanide solutions as described above.

So far we have been dealing with the question of solvent or chemical action only, but it is impossible to discuss the matter from this poiut of view alone, and it is necessary to consider the question of the "selective action" of dilute solutions upon ores as involving the effect of electric action also. For instance, a mixture of particles of metals cannot be treated by cyanide of potassium solution without bringing into play the action of the galvanic couples thus formed, nor, iudeed, can a mixture (say) of sand containing particles of zinc and gold (although these be not in galvanic contact) be treated with cyanide of potassium solntion without the formation of ganvanic couples and the consequent complication of the action, for as the gold enters into solution and is diffused throughout it, it comes in contact with the zinc, which precipitates it, and thus forms the galvanic couple.

So far as the solvent action of cyanide of potassium solutions, assisted by the electric current, is concerned, it has heen known for many years that dissimilar metals, when coupled together and immersed in solution of cyanide of potassium, give an electric current.

The experiments of Gore and Skey carried our knowledge somewhat further, and gave the electromotive order of the metals in solntion of cyanide of potassium. The following is the order given by these experimenters:

GORE. 0.625 KCy. = 0.25 Cy. Temp. 50° F.	GORE. 0.625 KCy. = 0.25 Cy. Temp. 100° F.	GORE. 285 KCy. = 11.4 Cy. Temp. 50° F.	GORE. 285 KCy. = 11.4 Cy. Temp. 100° F.	SKEY. KCy. = Cy. Temp. 50° F.
+Zn	+Zn	+Zu	+Zn	+Zn
Cn	Cu	Cu	Cu	Cu
Sn	Sn	Au	Sn	Su
Ag	Au	Ag	Au	Ag
Au	Ag	Sn	Ag	Au
Hg	Pb	Hg	Hg	Ph
Ph	Hg	Ph	Ph	Hg
—Fe	—Fe	—Fe	—Fe	—Fe

It will be observed that there are certain irregnlarities in the order in which the metals are placed in the above table, and the author has made three several sets of experiments, with the view of ascertaining the cause. He has found that in the case of silver and gold the action is very slight, and it is difficult to decide as to which should be classed as the most positive metal, but as silver is found to separate gold slowly from such solutions, it should be classed as positive to gold. With tin also the action is very slight, but it is abundantly clear that in all cases certain of the haser metals are positive to gold and silver, and certain others are negative to gold and silver.

If galvauic couples of these metals be formed and placed in solution of cyanide of potassium the negative metal will be protected from attack, while the positive metal will he dissolved; and the precipitation of gold and silver from such solutions by aluminum, zinc and copper is a good illustration of another form of this ganvanic action.

The application of the action of the electromotive force, shown in these tables, to practical metallurgy made by Skey was to indicate that, where cyanide of potassium solution was used in gold milling with the idea of brightening the mercury and aiding

* A paper read before the London Institution of Mining and Metallurgy, Nov. 20th, '95.

amalgamation it dissolved any salts of mercury, the formation of which had caused the flouring. The mercuric cyanide thus formed, when brought in contact with metallic gold, dissolved it rapidly, while the mereury was reduced.

Skey further points out that most, if not all, of the sulphides occurring in nature are negative to the series of metals giveu in the above tables, and in confirmation of this the author's experiments have shown that a very considerable current can be obtained from a series of galvanic elements eomposed of gold, with galena or pyrites. Not only so, but peroxide of manganese and magnetic iron ore give a very distinct galvauic eurrent in eyanide of potassium solution when coupled with gold.

Kobell ("Anzeigen der Munehener Academie, J. Pr. Chem. L. 76") suggested employing the relative eonductivity of minerals for the galvanic current as a mineralogical character, and he classed amongst the good conductors "the native metals (tellurium excepted), fahl-ore, mispiekel, galena, pyrrhotite, copper pyrites, magnetite, graphite, and many others." Where these minerals are associated with gold or silver in solution of cyanide of potassium, so that the particles are in galvanie eontaet, the eleetric current set up will have the effect of protecting the negative element at the expense of the positive element, which, in this case, will be the gold or silver.

Such an action is entirely comparable to that which is taken advantage of for the protection of copper sheathing ou ships by the use of the copper-zinc eouple, where the zinc is dissolved while it protects the copper from going into solution. Another example of a similar applieation is the use of sheets or pieees of zinc in steam boilers, to reduce or prevent the eorrosion of the iron.

If we now consider how this galvanic couple action affects the question of the so-called "selective action," there can be but little doubt that the solution of gold is cousiderably aceelerated by such an action. In the first instance it may be well to place beyond doubt the fact that au electrical current does very materially facilitate the solution of gold by cyanide of potassium.

An experiment was made as follows: A dilute solutiou containing 1 per cent eommercial KCy was placed in a glass beaker, 6 inches diameter, to a depth of 6 inches. Two iron rods, 1 inch diameter, were immersed to a depth of 3 inches in the solution, and kept 3 inches apart. An electric current, with an intensity of 6 volts, giving 1 ampere of current by actual measurement, was passed through the solution. A sheet of gold leaf, held between two pieces of muslin, was immersed in the solution between the poles. It immediately began to dissolve visibly, and within 1½ minutes had practically all disappeared.

An exactly similar experiment in every way was made without the electric current, the sheet of gold leaf, however, in this case taking over 10 minutes to dissolve.

Another experiment was made as follows: The solution was of the same strength as before, the poles were iron plates, the surface immersed measuring 3 inches by 1 inch on each pole. These were placed 4½ inches apart, and a leaf of gold was floated on the surface of the solution between them; a current of three-tenths of 1 ampere was then passed, and in 4 minutes the gold was almost entirely dissolved, a few small fragments remaiuing, probably having been slightly greasy.

An entirely similar experiment was made with a leaf of silver, which dissolved very rapidly and completely, and another experiment was made with fine gold dust sprinkled upon the surface of the solution, where it floated and gradually dissolved.

It will be observed that in none of these experiments was there any actual contact between the gold and the anode or cathode through which the electric current was passing, but the electric action was an indirect one. The effect of the electric current, where the gold forms the anode or cathode, is, of course, well known from the ordinary practice of electro-platers.

That a very considerable galvanic action is produced by galvanic couples of the natural sulphides of the baser metals and gold or silver is shown by small battery cells, in which galena and silver, iron pyrites and silver, zinc blende and silver, are arranged as galvanic couples, the current produced being sufficient, with a battery of one or two cells, to speak for itself through an electric bell, and also to drive an electric motor.

It may also be noticed that such galvanic couples may readily be formed in the case of gold ores by the gold coming in contact with small particles of metallic iron worn off the shoes and dies of the stamps, the wear of which often amounts to from 2 to 3 pounds of iron and steel per ton of ore, a quantity enormously greater than the amount of gold usually present in an ore, such as is treated by the cyanide process.

The results of a large number of experiments of the action of cyanide solutions of varying strengths upon actual ores might here be given, but the author has found that the results obtained with different ores vary so much that it is necessary to consider each ore by itself.

There is, however, no doubt that if the action of the eyanide solution be arrested immediately the gold has been dissolved, the dilute solution will be found to have dissolved—in the ease of most ores containing sulphides—less of the baser metal compound than will have been dissolved by the stronger solution. But this naturally follows, there beiug even in the most dilute solution employed an enormous excess of eyanide of potassium over the amount required for the solution of the gold, the excess cyanide, of course, exerting its solvent action upon the base-metal eompounds. For example, the most dilute solution indieated in the MacArthur-Forrest patent is to coutain 2 parts of eyanogeu to 1000 of water. If such a solutiou be used to treat an ore, sueh as Transvaal tailings eontaining 15 dwts. of gold per ton, there will be present about 160 times more cyanogen than is chemically required for the gold dissolved. Further, the amount of oxygen present in dilute solutious in the form of dissolviug air or oxygen is known to be greater in dilute than in strong solutions; and from this cause, as well as the greater mobility of the weak solutions, it would fairly be anticipated that the aetion of such more oxygenated dilute solutions would be greater upon gold or silver than that of the stronger solutions. The recent work of Maelaurin has plaeed this beyond doubt.

One illustration may be given. A gold ore, containing a small pereentage of iron pyrites, was treated with a solution eontaining 1.22 per cent of cyanide of potassium (equal to 0.49 per eent eyanogen) for a period of 48 hours. The solution was tested for the amount of gold and iron dissolved, and the figures—calculated to 100 parts of gold in solution—were:

Gold	100 parts
Iron	1450 parts

It seems, therefore, it could easily be foreseen that a solution containing no great excess of cyanide of potassium over that needed to dissolve the gold would dissolve more of it from the ore in proportion to the baser metals than a solution eontaining a large excess of cyanide of potassium which would act more upon the baser metals, and that the galvanic couples, formed of the sulphides, etc., assoeiated with the gold in the ore, would materially aid in the solution of the gold.

Further, as to the "concentrating" action. Starting with the faet that cyanide of potassium in dilute solutions was known to be a good solvent for gold, but not for base-metal sulphides, can it be a surprise to find that on treating an ore with such solution we obtain a larger proportion of the gold dissolved to that of the base-metal compounds compared with the amounts originally present?

Surely it is a mistake to call this a "selective action" in favor of the gold. The answer to the statement, as given in the judgment of the Court of Appeal, with which we started, that "a strong solution attacks the baser metals without attacking the gold, whereas a weak solution is feeble and nil on the baser metals, but attacks the gold," is entirely contradicted by the results of both experimental and practical working of the process, which show in almost every case that the action of solutious of cyauide of potassium, whether strong or weak, is to dissolve a much larger actual weight of base metal compounds than of gold, while the electro-chemical action set up by the formation of galvanic couples plays a most important part in the reactions that take place, the effect of which has not hitherto been sufficiently recognized.

Notes on Gold Milling in California.

NUMBER V.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

MILL PRACTICES.

Where the conditions permit, it is becoming the custom to place the grizzly and the rock-breaker in close proximity to the hoist, so that the bucket or car on arriving at the surface is dumped direct on a grizzly, and the crushed ore is then run over the ore-bin in the mill, and empied therein; where this is impracticable, the grizzly and rock-breaker are placed over the ore-bin in the mill.

The usual practice is to let the coarse ore from the grizzly drop on a platform on a level with the mouth of the rock-crusher, into which it is shoveled by hand; by this method the machine is not brought up to its full capacity. A better plan is to convey the coarse ore from the grizzly into the bin by means of a chute, having a sliding gate immediately above the receiving point of the crusher, and which is set so as to keep the space between the jaws always filled. In this way the work becomes automatic, and the services of the man attending the rock-breakers can be utilized in other parts of the mill during part of the time. Under such an arrangemeut the crusher will require more power, which should be independent from the other machinery. The rock-breaker is usually run during the daytime only, as it can crush in that time enough ore for the mill for the twenty-four hours.

The self-feeders, in a similar manner, are kept automatically filled from the main ore-bin. The feeding through the tappet striking on the bumper-rod of the self-feeder, has of late been modified. A collar is fastened below the guides on the feed-stamp stem, taking the place of the tappet, thus avoiding the long bumper-rod. The gauging of the feed must be earefully attended to, if the stamps are to work up to their full capacity there should never be more than 1 inch of rock between the stamp and die when they come together, or the feed should be just sufficient to keep iron from striking iron. When cleaning up the batteries, the self-feeders are drawn back on a track toward the ore-bin, giviug access to the back of the mortars.

In preparing the mortar for ore-crushing, an inch or two of tailings is spread evenly over the bottom before putting the dies in plaee, as this saves the wear on the bottom plate. After the dies are placed exactly under each stamp, crushed ore and fine rock are banked around them to retain them in proper place until the sands have settled firmly about them. Care must be observed to keep the tops of *all* the dies at the same level at all times, as otherwise, when the stamps are dropping the highest die will strike against iron, while the others are still supplied with sufficient ore; this is known as "pounding."

The stamp-head, or boss, is now plaeed on the die with the small conical opening at the top, and the stem lowered into it, iron against iron if it is a close fit, and driven in solid. In ease the conneetion is not tight, canvas strips about 2 inches wide are laid crosswise over the opening before the stem is lowered. The stem, with the stamp-head, is now raised until the lateh-finger eatches under the lower faee of the tappet and holds them suspended, and the shoe placed on the die. If the stamp-head hangs too low to permit of this, the stem is raised, and a block placed on top of the finger for the tappet to rest on. Narrow wooden wedges, about 1 ineh wide, the length of the neek of the shoe, and of the requisite thiekness to fit tightly into the conieal opening at the bottom of the stamp-head, are arranged in place and tied with a string. The block and finger are then removed, the stamp-head dropped over the shank, and wedges driven down firmly. This is done best by revolving the eam-shaft slowly, and, while placing the cam-stick between, permitting the eam to act on the tappet, raising and dropping the stamp until the lower edge of the stamp-head is nearly in contact with the shoulder of the stamp. It is not advisable to permit them to come solidly together, as it tends to loosen the iron ring that reinforces the stamp-head. A quick aud eonvenient method of placing the wooden wedges ou the shoe, is to cut a piece of canvas to fit exactly around the neck, and attach the wedges to the canvas by driving a tack through each one into the cloth. By keeping a supply of these on hand, it bccomes an easy matter to encircle the shank on the shoe and tie them fast, should the shoe become loose and drop off while the mill is running.

The Drop.—The uext operation is fixing the distance through which the stamp is to drop before striking the die. In most mills this distance is uniform for all the stamps; but, as previously stated, occasionally the stamp operating the feed, as also the two outside stamps, receive a greater drop.

The right height to give depends on the nature of the ore, as also on the speed to be given to the stamps; that is, the number of drops per minute. The tendency in most California mills is to run at a high rate of speed, usually in the neighborhood of one hundred drops per minute. The height varies from 4 inches to about 10 inches, generally but little, if any, above the water-level in the mortar.

In arranging the stamps for an equal drop, wooden blocks, cut about ½ inch longer thau the drop the stamps are to receive to permit the cams to clear the tappets, are placed on the die, between it aud the shoe. Pieces of 2x4 scantling, cut to the desired length, answer well for the purpose. The keys in the tappet are loosened with a drift made of steel, the size of the keyholes, and used only for that purpose, and the stem is allowed to slip through the tappet until the shoe rests on the top of the wooden block beneath; or, if the shoe was resting on the block previously, the tappet is slipped up till resting on the latch-finger, when the keys are driven home solid. Care must be exereised not to drive the keys too solid, else there is danger of splitting the tappet. For the convenicnce of the millman a chalk mark is made around the stem just above the tappet, which enables him, while running, to at onee deteet if any of the tappets have slipped. Should this occur it must be immediately re-set, or the battery work will be irregular. The battery-plates and choek blocks are next put in place and keyed.

(To be Continued.)

* Bulletin No. 6, California State Mining Bureau.

FRENCH JOURNALS report the aluminum torpedo boat, recently built by an English firm for the French Navy, is a failure. The metal has corroded to such an extent during the time the vessel has been in the dockyard basin that it can be penetrated with slight pressure. The boat is said to be unfit for service, and the French Navy Department has renounced the idea of building any others, and has ordered the torpedo cruiser Foudre to be supplied with steel boats instead of aluminum boats, as originally intended.

Mining Summary.

CALIFORNIA.

Amador.

A SAMPLE OF RENEWED LIFE.—About six miles above Sutter Creek there has been in steady operation for the past nine months a small mine and six-stamp mill connected therewith, owned by J. Treadwell. It was operated seven or eight years ago by S. D. R. Stewart, who erected the mill. After giving the property what he considered a fair test he abandoned it as unprofitable. It was reopened last February by the present owner. After working several months with indifferent success, a new ore body was encountered, which has proved of a paying grade, and the mine has been worked at a profit ever since. The claim is six miles east of the mother lode. It gives employment to from fifteen to twenty men.

GENERAL MINING NOTES.—*Ledger:* A Grass Valley man is building a plant for saving sulphurets from the Zeile mill. It is estimated that $40,000 in sulphurets goes down the creek annually from this mill. This is no reflection upon the millmen, as the percentage of loss in the Zeile will bear favorable comparison with any mill in the county. Several attempts have been tried to work the tailings after leaving the mill, but all with indifferent success. The great obstacle has been the difficulty of securing fall to carry off the waste. The Grass Valley proposition is to elevate the tailings before extraction.

The Volcano Gold Gravel Company is building a flume 1000 feet long to work the Peck claim in the Volcano basin.

Calaveras.

THE NIGHTHAWK MINE. — *Citizen:* Burns and Pfortner got to the bottom of the gravel, which is of a cement nature, and can be best worked by mill or arrastra. They are now arranging for machinery.

El Dorado.

AROUND PLACERVILLE.—(Special correspondence.)—C. J. Heald is operating a five-stamp mill on his plant near Nashville, twelve miles south of here, and is taking out ore that averages $15 per ton. This is known as the Montezuma mine.

E. W. Chapman is erecting a twenty-stamp mill on the Zandgraft mine, twenty-five miles northwest of Placerville. A large body of ore is encountered on the 400 foot level. The hoisting works are in operation, and it is expected that the mill will be ready for work within sixty days.

Lyons, Gifford & Tong are running a five-stamp mill near Clarksville, twenty miles south, developing four claims. Their ore averages $8 per ton.

The Big Channel Bend Company are erecting a five-stamp mill near Volcanoville. E. W. Chapman has an interest in this plant and is also superintendent. This is the property of a San Francisco company.

Work has been resumed on the old Doncaster mine, near Kelsey. This is owned by Germyn Brothers, of Scranton, Pennsylvania. The shaft has reached a depth of 100 feet.

Sam Lane is operating a five-stamp mill in the old Stillwagon mine and taking out $30 rock, twenty-seven miles southeast of here.

The Gray mine, thirteen miles west, has been bonded to J. Graham of Chicago. Two shifts are at work and the shaft is being continued from the 150-foot level. In 1872 this property produced $110,000.

M. & C. Farozza are running a tunnel on the Old Try Again, two miles north of town. They have attained a length of 1400 feet and expect to tap the channel at another 100 feet.

J. I. Reid has bonded 800 feet to J. E. Spencer. This is located within the town site, and is on the mother vein. It has two tunnels, and a shaft 100 feet deep. The ore taken from the shaft and tunnels will average $50 to the ton.

Inyo.

THE CASEY MINE. — *Register:* The new hoisting plant at the Casey mine is now in operation. The mine has been prospected to a depth of 450 feet, and Supt. Duenweg expects to sink as far as the cable will permit, or 800 feet in all. He has an offer for working the tailings by the cyanide process.

Lake.

QUICKSILVER AT SULPHUR BANKS.—The output of quicksilver has been 500 flasks per month for the last three months. The shaft is 200 feet deep, fifty men are employed.

Nevada.

PROPOSED CONSOLIDATION. — Gen. A. M. Dobbie of North Bloomfield tells the *Tidings* that he is interested in a plan of consolidating all of the gravel claims along the ridge, from the Derbec northward for six miles, into one extensive corporation: stock to be issued to the claim owners, proportioned to the number of acres held by them, and then drive a tunnel from the Derbec northward, all the time working in the pay gravel that is known to exist. The expense would be borne by the syndicate of claims composing the company, to whom the profits would also be distributed. The Derbec would be a favorable point to start from, as the mine is naturally drained. The General states that he is meeting with much encouragement from the various claim owners to whom he has submitted the plan.

A RESTRAINING DAM.—A dam built to restrain the debris from the Omega gravel mine is finished at Scotchman's creek. From bedrock to the bottom of the dam is 100 feet, the distance across creek on top of dam is about the same. The lower section is built of logs A-shaped, the ends of the logs on the lower side set in a groove of bedrock. The upper section, built further up stream, the foundation imbedded in tailings, is of brush forming two slanting walls the stock ends of the brush to the outside, as the walls were raised earth and rocks were sluiced in forming an embankment tapering from 150 feet at the base to about forty feet at the top. After the dam reached the required height a canal six feet deep was cut through the solid bedrock a short distance from the north end to carry off surplus water in case of a freshet. For ordinary purposes a heavily timbered shaft beyond the up-stream wall connecting with a bedrock tunnel under the dam will be used. This shaft will reach to the surface of the reservoir formed by the structure, and will only carry the water after the debris has been precipitated.

ORGANIZED AT MAYBERT. — The Fountain Head Gold Gravel Mining Company has reorganized at Mayhert; membership fee, $30; M. A. Baugh, W. H. Frye, C. A. Lillie, C. C. Whittaker, J. W. Zeigler of that place are directors.

THE OLD BOWMAN MINE.—The *Telegraph* hears that the General Bowman mine is to be reopened by an English concern. The mine is situated near Bowman's lake and was worked thirty years ago.

THE W. Y. O. D.—The W. Y. O. D. is one of the mines that maintains a regular output. It has to its credit a total production of $550,000, of which a good portion has been disbursed in dividends, and over $100,000 spent in improvements. The total amount levied in assessments by the company for the purpose of starting the property was $22,500. The company recently purchased the General Grant, formerly known as the Telegraph mine, and the Parr claim, extensions of the W. Y. O. D., both of which are patented and on which development work is now being carried on. At the present time the mine is 1450 feet in depth and preparations are being made to continue sinking. During the past twelve months 1700 feet of upraises have been run, the shaft sunk 400 feet and drifts run 3500 feet. Fifteen levels are opened up and work is being done in ten of them—all below the 600 level. The vein courses northerly and southerly, the same as in nearly all the other mines of the district, and dips to the west. The average size of the ledge is from twelve to fifteen inches.

Placer.

MINING IN THE MIDDLE FORK.—*Herald:* On the middle fork of the American river, after connection with the north fork, a number of men are engaged in mining. The opening of the old mining claims and working over of the sands of the river bed seems to be quite extensive. Mining in that direction is having an upward tendency and is in demand.

The Mammoth Bar mine on the Middle Fork, under Messrs. Davis' supervision has shut down work for the season.

AROUND MICHIGAN BLUFF. — *Herald:* The mill on the American Bar mine is completed.

The Dixon mine at Deadwood has closed down for repairs.

The New Treasure Company are pushing their tunnel ahead.

The Grey Eagle Bar Company have completed their shaft and have one of the best equipped gravel mines in the State.

NEAR CISCO. — *Sentinel:* The Henrietta Mining Company is working a ledge of decomposed quartz on Red mountain, near Cisco, by the cyanide process.

GENERAL NOTES.—*Herald:* At the Eureka Con. drift mine the company are pushing the tunnel. This claim is the largest drift mine in the State, being composed of 3600 acres.

At the Adams mine, between Auburn and Newcastle, the shaft is down over 200 feet and the ledge is increasing in size. Drifts have been started on the 200-foot level.

At the Hathaway work is being pushed on the 400-foot level and the quartz is richer than that found in the levels above.

The bullion shipment from the Mayflower mine for November amounted to $16,000. This mine employs about 115 men at present.

Plumas.

GOOD PROGRESS. — *National-Bulletin:* The large jack-head pump recently put into the shaft on the Elizabethtown Channel mine, works satisfactorily. Drifting through soft shaly bedrock towards the channel progresses.

Riverside.

THE GOLDEN CHARIOT.—At a depth of 300 feet a four-foot ledge has been struck in the Golden Chariot mine at Perris.

THE SANTA ROSA.—The Santa Rosa is now down to a depth of 450 feet, and the drifts extend both sides of the shaft 750 feet. The ten-stamp mill which has been running has recently been doubled in capacity.

San Diego.

AT JULIAN.—A crushing of twelve and a half tons of ore from the Golden Rule mine took place last week at the Ready Relief mill. The lot was sorted into two patches. Seven tons of high grade ore went $107 per ton and five and a half tons second-class rock went $21 per ton.

Sierra.

CONTRACT LET.—T. Williams has a contract to make an upraise of 325 feet in the face of the tunnel at the Pine Tree mine, near Sierra City.

Siskiyou.

BOUGHT SEVEN CLAIMS.—The Fidelity Investment and Development Company of this city has bought seven claims, under the name of King Solomon's Mines, on Matthews creek, two miles from the south fork of Salmon river.

THE UNCLE SAM. —*Union:* The Uncle Sam mine, on Forks of Salmon river, which was recently bonded to a San Francisco company for $60,000 is to be started up and will be operated by J. F. Boyle.

NEVADA.

WIRE CABLE.—Peck Bros. have let a contract for a mile and a quarter of wire cable tramway to be put up between the Morgan mill and the Mexican for transportation of tailings.

STOREY COUNTY.

LATE MINE REPORTS.—CHOLLAR—There is no especial change to report of the workings above No. 2 crosscut and the south drift from it on the 450 level. We continue to follow the pay which lies in streaks and bunches. Repairs in main shaft and on the 500 level are under way. We have saved and shipped to the Nevada mill for reduction 57 tons and 1600 pounds of ore, which has been allowed to accumulate for a run.

ALPHA.—During the past week the raise in the southwest drift from the west crosscut was advanced 10 feet; total height, 17 feet; passing through a mixture of porphyry and quartz of low grade. Face is now in quartz assaying $5 per ton. The southwest drift from the west crosscut, 450 level, has been extended during the week 7 feet; total length, 30 feet; face in quartz giving assays of from $5 to $10 per ton.

POTOSI.—In the stopes above the north drift from the east crosscut, 550 level, we have opened the fourteenth floor, and find that, though the quartz continues, the value per ton has decreased so much as to preclude its extraction. We are stoping on the twelfth and thirteenth floors, where we are now getting a little pay ore of fair grade. On the eighth and ninth floors we are saving some old fillings that are about of sufficient value to warrant extraction. On the sixth floor we are running a west crosscut which is now out 20 feet in low-grade quartz. The raise from the 550 level track floor, south drift, is up two floors in old ground, the fillings in which assay in places. We have shipped during the week two bars of crude bullion, showing a par value of $10,189.67.

ESMERALDA COUNTY.

OPHIR AND PAYGRIT.—The Ophir and Paygrit mines, in Central district, are sold to C. H. Wilbur of Salt Lake City; price, $2500. The new owner has also bought a five-stamp mill, which is near White Plains, and will remove it to Central.

NYE COUNTY.

Theo. Cirac & Sons' gold mill at Union Canyon, near Grantsville, started up on the 28th ult.

LANDER COUNTY.

A BIG INCREASE.—The *Silver State* says that "the Austin Mining Company of Austin has increased the working force by 100 employes."

OREGON.

SALE CONFIRMED. — Judge Fullerton, at Roseburg has confirmed the sale of the Annie mine in Bohemia district, made by Receiver Younger to G. E. Milligan of Chicago. The mill and mine are in operation under the management of P. J. Jennings. A force of men has been put on to drive a lower tunnel in 340 feet. A winze sunk on the ledge at the depth of fifty feet showed black sulphites. The intention is to expend a large amount of money developing the mine, and plans for a new twenty-stamp mill will be made in January.

THE OCHOCO MINES.—E. N. Kluge, representing a mining company of New York City, has bought and bonded all the placer ground in the Ochoco mines, five miles in length by 300 feet wide, together with the water rights, flumes and ditches. It is the intention to construct reservoirs for storing water in the vicinity of the ground they have bought, so that next season they can operate the mine to advantage. They will put in a sawmill at an early date to saw out lumber for a bedrock flume, which will be some three miles in length and will open up the mine on scientific principles. The ground which this company now has control of has been worked more or less since the spring of 1871, but no one has ever had hold of the property who had enough capital to work the ground as it should have been, hence the results have been varied.

The Princeville *Review* says Mr. Kluge paid over $5000 for a half interest in the Ochoco mines, and has an option until next June on the claims held by the Belkuap-Perry-Fuller Company, and that Mr. Kluge says he will return next spring and put in a $5000 plant.

BRITISH COLUMBIA.

BETTER MANAGEMENT. — Under the new management at the Number One mine at Ainsworth, with a force of one-fourth that were formerly employed, they are taking out double the amount of ore. They now have 100 sacks ahead of the teams. The *Tribune* says: "The bulk of the ore runs from 80 to 100 ounces and some of it from 1000 to 3000 ounces. The concentrator is closed down for the winter."

THE WORK WELL IN HAND.—The Hall mines smelter at Nelson is completed, the tramway is delivering ore, and is expected to be in operation Jan. 1st, '96.

AT ROSSLAND.—The contract for the tramway from Rossland to Trail has been let and the work begun. The route will cover twelve miles.

UTAH.

MERCUR DISTRICT. — (Special correspondence)—Since Captain J. R. De Lamar of New York arranged in September last for the purchase of the control of the stock of the Mercur Gold Mining and Milling Company, whose mines are located in Camp Floyd district, in Tooele county, Utah, the argument has been freely urged, until the last few weeks, that the purchase price was excessive and wholly unwarranted. The Mercur property was originally capitalized for $5,000,000, divided into 200,000 shares of the par value of $25 each. Up to and including October 21st, 1895, the company had paid dividends amounting to $1.75 per share, or a total of $350,000, and when the payment of dividends had been commenced the company had paid for all its property and had discharged all its debts. This property consists of 136 acres of surface locations, embraced in the original ten claims of the company, and about thirty-two acres additional that were purchased just before the deal was made for the sale to Captain De Lamar. Added to the actual mineral properties is a mill with a total daily milling capacity of 200 tons, numerous mine buildings and offices, and an independent water right, derived from a spring situated on the ground of the company, a consideration of no little value itself in a country in which water is so scarce that one company has just completed the construction of an expensive pumping plant and a pipe line fourteen miles in length, at a cost approximating $75,000. The flow from this spring has been enough to supply the mine and mill and to furnish all the water required at the Mercur end of the line by the Salt Lake and Mercur railroad.

The ore bodies in the mine run from four to thirty-six feet in thickness, carrying ore of a value that has never averaged less than $11 per ton. The mill treats 200 tons of this ore per day and saves 90 per cent of the values, or say $1980 per day. The cost of mining and milling the ore is, according to the owners, $3 or less per ton, but accepting $3 as the cost and $11 as the maximum value per ton of the ore, the present milling capacity of the property provides for net earnings of $1380 per day, or in round numbers, $500,000 per year. The ore necessary to this result is to be taken from a vein with a maximum dip of 19 degrees to the northeast, the Mercur Company's ownership on the vein being represented by 168 acres of surface locations. Over this entire area prospecting has been conducted from the start, with the result that the ore carrying the values has been found at all points at which prospecting has been prosecuted, while in the main workings of the Mercur mine ore bodies sufficient to supply the present mill for a period of five years have been blocked out.

The price which Captain De Lamar will pay for this property is $7.50 per share of the capital stock, which places a total valuation on the property of $1,500,000. This the croakers say is too much, but inasmuch as they took no part in the development of the district which has now become famous, their opinions as to the value of any proposition therein are not entitled to much weight. Moreover, if any one should find on his 160 acres of land a vein of gold-bearing ore averaging twenty feet in thickness and $11 in gold per ton, underlying the entire farm, he would probably be overwhelmed with offers in the neighborhood of $1,500,000 for his entire interest. And yet this is exactly what the Mercur people have done, excepting that they have proveu the existence of the ore body under the entire area and have demonstrated the utility of the process of leaching the gold by the use of cyanide.

SILVER REEF.—The Barbee & Walker mill at Silver Reef is testing a new process that is expected to "revolutionize the methods of handling ore in that locality." There is plenty of ore there.

A FINE PLANT.—At Green river, six miles below the station of Green River, on the Rio Grande Western Railway, have arrived twelve carloads of machinery, including a Bennett placer machine which cost $40,000. It scoops up 2,000 cubic yards of gravel in ten hours, pumps up the water with which to wash it, screens the dirt and sends the gold and black sands into an amalgamator. It is illustrated and described on page 392.

There is much gold in the bars along Green river, but it is extremely fine. If this undertaking is successful it means a good fortune to the promoters.

The Northern Light mine, on Lion hill, Ophir district, has been sold for $58,000 to Messrs. Dern and Airis, formerly owners of the Mercur. The Northern Light was a famous producer of high grade silver ores in early days.

The wet ore famine of the Salt Lake smelters has revived interest in the La Plata district, north of Ogden. Some of these ores run as high as sixty per cent lead, but very low in other metals.

A reduction plant is to be established at Park City for the treatment of the zinc ores found in that district.

IDAHO.

IN THE CŒUR D'ALENES.—The Morning mill started up this week.

At the Bunker Hill mine they are blasting out a station for another shaft on the Reed tunnel level.

Work on the big tunnel at the Standard is being pushed. The tunnel will be 3300 feet long, and will tap the mine at an enormous depth. It is now in about 800 feet, and the work is progressing at the rate of about 200 feet a month. When completed electric cars will be put in to haul the ore out; also a passenger car will be added to carry the miners to and from work.

More than 150 men are now at work on the Frisco.

The Gem is working three eight-hour shifts on the shaft.

The Last Chance is producing considerable ore.

AT GIBBONSVILLE.—The Idaho Gold Reduction Co. suspended payment last August, throwing out of employment over 100 men, and stopping work on the new stamp mills, roasters and general development work. The property was placed in the hands of a receiver, who will dispose of the personal property to settle some of the indebtedness.

The Hughes Creek Placer Company also failed last summer. A syndicate has now taken a bond on the property and will go ahead with the work.

The American Development and Mining Company have thirty stamps crushing 125 tons of sulphuret ore every twenty-four hours. They concentrate it to about one-tenth, saving what they can on the plates. To reduce the concentrates they have just started a twenty-ton per day roasting and chlorination plant. It is the intention to put in thirty more stamps next spring.

A NEW CYANIDE PLANT. — At Dixie, D.

Rieber will add a cyanide plant to his new mill. The ore goes $22.50 a ton.

MONTANA.

GENERAL MINING NOTES.—J. Valley is reported negotiating the sale of his Granite Bello mine to C. Clark at a figure approximating $15,000.

The mineral output for Butte since 1880 has reached a total of $226,000,000. The total for the present year is estimated at $31,000,000.

It is expected that the report of the Boston & Montana Mining Company for this calendar year will show a surplus of $750,000 after paying $7 per share in dividends, and ground opened for eight years ahead.

A GOOD SHOWING.—From Helena, comes the statement that there are now more men at work in the mines of Montana than before the slump in silver. In Butte the copper mines have increased force and output until they are employing 800 more men than at any previous time in the history of the camp. Mining men have also turned their attention to the gold leads, and active prospecting is going on everywhere. About fifteen miles from Helena city a porphyry dyke, which was known to carry gold, has been prospected thoroughly, and several mills are now operating successfully. This dyke is twelve miles long and 600 feet wide. It will average $4 to $5 per ton. Claims are being staked and sell rapidly.

A MINING DEAL.—C. Child of New York has bought the Prize mine in Granite district. The purchase price is not stated, but the first installment, $150,000, is reported paid in cash. The mine was discovered five years ago by the Murray brothers and in that time they have taken out $85,000. It has a ten-stamp mill. The shaft is down 300 feet and there are about 700 feet of levels. The expert who examined the mine just before the deal was closed said there was $1,000,000 worth of ore in sight. The new owner will erect a steam hoist and provide additional mill capacity.

MISSOURI.

LEAD AND ZINC.—A new town called Duenweg has been laid out, twelve miles from Carthage, Mo., on the site of the rich strikes of lead and zinc which were make last summer. All the land in the vicinity has been leased, hundreds of prospect shafts are being sunk, houses are in course of moving from neighboring towns, and new ones are going up in all directions. The railroads near at hand, the Missouri Pacific and the Gulf, have connected the new town by junction lines with the rest of the world.

MICHIGAN.

TWO DIVIDENDS.—The Kearsage Copper Mining Company declares a $1-per-share dividend, payable on the 30th, the first in six years. The Osceola Consolidated Copper Mining Company has declared a dividend of $1.50 per share, January 15th, the first dividend of the year and the fortieth in the history of that property, making a total of $2,022,500.

COLORADO.

THE LEADVILLE OUTPUT.—Leadville mining men state that over 1,300 tons a day are now being mined. The output for '95 will be over 200,000 tons, and the value of this ore will be in the neighborhood of $10,000,000.

THE RICO MINES.—The Rico-Aspen Mining Company have closed two of their properties and will not resume work on them till spring. No reason is given. Since the closing of the smelter both the Syndicate and Stephenite were not producing a grade of ore that would pay to ship to smelters elsewhere. The immense fall of snow no doubt hastened the closing of these properties, as it was with great difficulty they succeeded in packing what ore they had broken to the railroad transportation. Other properties of the Rico-Aspen Company are still being worked with a larger force of men than heretofore, and they are producing large quantities that net a profit.

ON THE ANIMAS RIVER.—At Baker's Bridge on the Animas river, twenty miles above Durango, the river rushes through a box canyon 600 feet long and from forty to fifty feet wide. At the lower end of the canyon a shelving rock across the mouth forms a pocket of the entire canyon into which it is presumed that the gold which is found above the canyon has been settling for ages. A company organized by Denver parties has secured the surrounding placer ground, erected a dam across the head of the canyon and turned the course of the river. The company recently pumped the water out of the canyon, preparatory to sinking a shaft in the cement which has formed in the bottom of the canyon. Leaks in the dam delayed operations but the leaks have now been stopped, and as soon as the silt which has been deposited since the commencement of operations is disposed of the company proposes to sink a shaft to bedrock and crush and wash the cement in which it expected to find the gold.

NEW MEXICO.

SUMMARY OF MINERS' EXPERIENCE AT LA BELLE.—A number of placers have been located and a few worked with some success. The value of the gravel varies from thirty cents to $3 per cubic yard; thickness of gravel varies from two feet to ten feet, as so far developed. A small amount of sluicing has been done and some work with a giant. The comparatively limited water supply prevents extensive work except during the spring months. The spring of 1896 will witness great activity in placer mining in this district.

The development work done on lodes is limited in extent, although a few of the claims have considerable work done on them. The increase in value with the depth is regular and continuous. The ore is in every case largely (sixty to seventy per cent) free milling. The tailings will concentrate about twenty or thirty to one, and will reach values permitting of shipping at a good profit.

The ores of the district at present yield sixty per cent of their values readily by stamp milling, while bumping tables for the tailings will concentrate the latter twenty or thirty to one, with a maximum loss of fifteen per cent. The Pelatan-Clarici process appears to be peculiarly adapted to the treatment of these ores. A test recently made on a sample of "Midnight" ore yielded ninety-nine per cent of its gold value and sixty-three per cent of the silver value, by this process.

ARIZONA.

MINES BONDED.—The Copper Queen Mining Company has bonded the Hughes, Aimee, Daisy, Winnie, Crest, Little Mammoth and Surprise in Mineral Hill district, near Tucson, for $70,000; $3,000 down; bond to mature May 30, '96. Meantime the mine is to be worked by the company and a royalty of $2 per ton is to be paid by the company on all ores extracted to be deducted on final payment, if the deal goes through.

INCREASED WORK.—The Mineral Hill Mining Company ships 18 ore to Bisbee. The force is increased from 35 to about 125 and the output of ore increased to forty tons per day. The ore averages twelve per cent copper. It also carries some silver and gold. The camp is seventeen miles from Tucson.

LOWER CALIFORNIA.

PYRAMID MINING CO.—The Pyramid Mining Company, W. E. Howard of San Diego, vice-president, will shortly begin operations on a large scale at Juarez, ninety-five miles south of San Diego. The company have two concessions of 8,000 acres of placer ground, besides 231 placer claims, and an expenditure of about $15,000 will be made in machinery and in preparing to engage in active work.

Personal.

H. A. RUSSELL is new selling agent of the General Electric Co.

E. BOYCE, an agitator from Wallace, Idaho, is addressing miners in Nevada and Placer counties.

L. B. STEWARD of the Everett mill goes to Deaver to take charge of a similar institution there, at an annual salary of $5000.

F. R. CULBERTSON, formerly superintendent Tiger mine, Burke, Idaho, is now general manager Consolidated Tiger-Poorman mines.

WILLIAM S. HEGER, the Pacific coast manager of the Westinghouse Electric and Manufacturing Co., has this week established his headquarters at 228 Bush, the ground floor of the Mills B'ld'g.

S. C. THOMPSON, of the firm of Maltman & Thompson, reduction works, near Grass Valley, Cal., goes to Johannesburg, S. A., to take charge of mining properties. Were the California miners in South Africa to hold a reunion in '96 it would take a big hall to hold them.

GOV. H. G. BLASDEL and wife celebrated their golden wedding at their home in Oakland on the 9th inst. The occasion was also the silver wedding anniversary of their son, Mr. S. W. Blasdel of Portland. Gov. Blasdel was elected the first Governor of the State of Nevada in 1864, and is now a San Francisco manufacturer. In his Oakland home, last Monday night, where four generations of the family were represented, from the seven-months old great-grandchild to the pioneer of seventy years, he seemed as stalwart and of as commanding presence as in the first days of the "battle-born State," over thirty-one years ago.

S. H. H. CLARK, president and managing receiver of the Union Pacific, says there is no ground for the report that a wealthy Eastern syndicate, headed by the Goulds, Sage and the Vanderbilts, is planning to secure control of the road and take it out of the hands of the receivers. The road will never be able to pay the interest on its debt and its operating expenses, and, therefore, shrewd financiers are not anxious to buy it at present. "Something," says Mr. Clark, "must be done this winter in the way of a settlement of the indebtedness of the road, or it will be entirely bankrupt. The reorganization committee is at work formulating a plan. It proposes to make a new bond issue for the total indebtedness at a rate of interest that will enable the road to meet its fixed charges. Then preferred stock is to be issued to cover the deficit caused by reducing the interest. This stock may be of value in case the road ever earns an excess over its running expenses and fixed charges."

Catalogues Received.

FRASER & CHALMERS, Fulton and Union Sts., Chicago; London, Eng., 182 pp., orange and black, 6x9 in. Gold and silver mills; catalogue No. 4, giving illustrated description, sectional and longitudinal views of rock-crushing machinery, perforated metal, automatic ore feeders, mortars, shoes, dies, cams, tappets, steam stamps, stamp-mill supplies, wet and dry crushing silver mills, roasting furnaces, ore dryers, belt elevators, power and water for stamp mills, tables, recipes, belt gearing, etc., etc., a catalogue of unusual merit; giving considerable valuable information apart from any advertising tendency. "Notes on Gold Quartz Milling at El Callao," "How Cheap Can Gold Ore Be Worked?" and other data are of special interest to miners. The plates for the illustrations are especially good, many of them having been prepared for the present work.

THE Stilwell-Bierce and Smith-Vaile Co., Dayton, Ohio, 112 Liberty St., New York, 52 pp., 6x9 in., pigeon's egg, gilt enamel; describes and illustrates filter presses, all styles and sizes, for every duty.

THE same company, 134 pp., 6x8 blue and bronze; steam pumps, pumping engines, condensers and artesian-well machinery, of every description and for every purpose, copiously illustrated.

(Catalogues and treatises mentioned in this review are sent free by their publishers on application.)

Coast Industrial Notes.

—The Salem, Or., Street Railway Company passed into the hands of a receiver on the 4th inst. The action was caused by the failure of the company to meet notes for $8,712.

—The California Machine Works (William H. Birch & Co.) have leased the premises formerly occupied by the Pacific Iron Works, and have removed to 129 First street, this city.

—The Pacific Cable Co. was incorporated in Albany, N. Y., this week, with a capital of $1,000,000, to run its own or leased wires from New York to this State, thence under the Pacific ocean to Japan, touching Hawaii and other islands on the way; thence to the continent of Asia and islands adjacent thereto, including the islands of Australasia, an extensive programme.

—To illustrate what Japan is doing in the one line of cotton manufactures, it is noted that in 1885 Japan imported $800,000 worth of raw cotton for the 50,000 splindles in nineteen mills, and in 1894 $19,500,000 for 600,000 spindles in forty-six mills. Their imports of cotton yarns from Great Britain decreased proportionately the same time. Japanese mills paid handsome dividends last year.

—Bids for building the new Union Ferry depot in this city were opened by the Harbor Commissioners last Tuesday. There were fifty-two in all. The sum of the bids, walls faced with buff brick, was $471,022; sandstone facing, $522,022. On the iron work the Risdon Iron Works was the lowest bidder, $188,000; on the carpenter work Bateman Bros. were lowest, $48,400; plumbing, E. J. Duffy, $11,123; roofing, William Crouin, $43,599; painting, G. J. Smith, $11,900. The work will shortly be awarded.

—On the Columbia river, during 1895, 617,460 cases of salmon were packed. Each case holds 48 1-lb. tins. The value was $3,342,928.65. Of these, 433,178 cases were packed on the Oregon side and 184,282 on the Washington side. On the Oregon coast streams and bays 62,620 cases were put up. About 64 per cent of the catch on the Columbia river was taken with gill nets, 12 per cent with seines, 19 per cent with traps and 5 per cent with wheels. The number of persons employed in the fisheries and allied industries in Oregon during the year was 5349, to whom was paid $1,236,246 for labor. The pack this year was larger than for any season since the origin of the industry, save two—1883 and 1884—when the pack was 629,400 and 620,000 cases respectively.

—Considerable comment has been caused by the announcement that the S. P. Co. has placed an order with English iron makers for 10,000 tons of steel rails. This is the first importation of any consequence for some time, and is a result of the advances made in the last few months in the price of rails in this country, taken together with the present reduced tariff rates. The order was placed with the American representatives of Cammell & Co. of Sheffield, England. President Gates of the Illinois Steel Co. says in regard to the incident: "Wherever railroads wish to buy rails where the freight cuts an important figure in the cost under the low tariff rate of $7.84 per gross ton, the American manufacturer is always seriously handicapped. As an illustration, the purchase of those 10,000 tons of rails: The freight on these rails, all rail, from Chicago would have been $13.44 per gross ton; added to our price of $29, free on board Chicago, would have made the price $42.44. The English manufacturers are able, on the ground of lower cost, which is solely in labor, to produce and sell their rails at the present time for $23.14 per ton; they would have no trouble, in my judgment, in obtaining a freight rate of $2 per ton from any English port to San Francisco, as, were English vessels not to take this freight at a low rate, they would have to go in ballast, and as there is a large quantity of wheat shipped from San Francisco boats are always glad to get any freight, and consider it clear profit over and above the cost of loading and unloading for any carriage they may obtain. Taking the English price of say £4 15s, which is their present price, figuring a pound sterling at $4.88, would make the cost of the rails, f. o. b. English port, $23.18; $2 freight to San Francisco, $7.84 duty, and 25 cents for commission and insurance, would make the cost of rails laid down at San Francisco $33.27 per ton, as against our price of $29, plus the freight to San Francisco, $13.44, equals $42.44. As long as the American manufacturer is paying the present scale of wages we cannot hope to compete with the English manufacturer at any port on the Gulf of Mexico or Pacific coast unless our freight rate is under $5 per gross ton. If we had attempted to meet the English competition on these rails we would have had to sell the rails at $19.79 per gross ton at our works, plus freight, $13.44, equals $33.23. I have prepared careful and correct figures to show what the loss to the laboring man and the railroads and the lake carriers is in the United States on account of this order having been placed in Europe. These figures are as follows: To the railroads—On account of 24,000 tons of ore at 60 cents from mine to lake port, $14,400; on 15,000 tons of coke at $2.75 from the ovens to Chicago, $41,250; on limestone, 5000 tons at 55 cents from the quarries to Chicago, $2750; on 8000 tons of coal at 70 cents from mines to Chicago, $5600; on freight, 10,000 tons at $13.44 from Chicago to Pacific coast, $134,400. To the lake carrier—24,000 tons of ore at $1.05 from port to Chicago, $25,200. To labor—On 24,000 tons of ore at mine at $1, $24,000; on coke and in mining the coal, 15,000 tons at 80 cents at the ovens, $12,000; on limestone, 5000 tons at 35 cents at the quarry, $1750; on 8000 tons of coal at 55 cents at the mine, $4400. To labor and manufacturing—10,000 tons at $5 per ton, $50,000. Total, $315,750. As transportation represents practically all labor, it means this amount has gone into English coffers instead of being distributed in this country."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 3, 1895.

550,580.—SHIP—J. Bluemel, S. F.
550,864.—EYE GLASSES—A. E. Butterfield, Portland, Or.
550,743.—GAS ENGINE IGNITER—T. G. Cantrell, S. F.
550,710.—IRRIGATION GATE—J. M. Eads, San Bernardino, Cal.
550,711.—IRRIGATION GATE—J. M. Eads, San Bernardino, Cal.
550,718.—BICYCLE BELL AND BRAKE—W. A. Hay, S. F.
550,730.—GATE—C. A. Huffmaster, San Leandro, Cal.
550,721.—ROTARY ENGINE—J. D. Keller, Santa Clara, Cal.
550,688.—ELECTROTHERAPEUTIC APPARATUS—C. Palmleaf, Seattle, Wash.
550,696.—CAN—M. L. Schlueter, Oakland, Cal.
550,927.—PILE COVERING—C. H. Staniforth, S. F.
550,922.—CONDENSER—H. H. Tracy, Hollister, Cal.

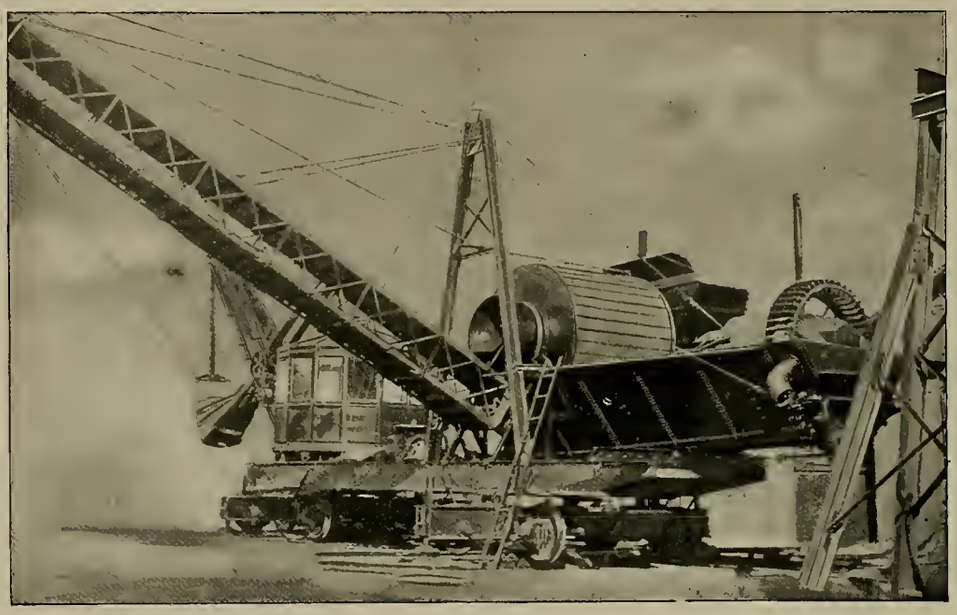
NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE BRAKE.—Jorgen Christensen, San Francisco, Cal. No. 550,067. Dated Nov. 19, 1895. The object of this invention is to provide a brake for bicycles and other vehicles, and it consists in applying a retarding pressure upon the rim or tire of the vehicle by means of rollers, which rotate in contact with the rim, and having means for increasing the friction and retarding their rotation directly in proportion as pressure is applied to force them against the rim. These rollers are mounted upon shafts which converge upon opposite sides of the wheel, said shafts being flexibly united at their upper ends, having their lower ends slidable in guides, a means connected with the jointed ends of the shafts for tilting the shafts so as to move them in lateral planes to or from the wheel rim, disks pressing against the upper and lower ends of the rollers and springs surrounding the shafts and compressible between the guides through which the shafts are slidable.

SOLDERING MACHINE.—M. Jensen, Astoria, Or., assignor of one-half to the Jensen Can Filling Machine Co. No. 550,176. Dated Nov. 19, 1895. This invention relates to improvements in machines for soldering cans. In consists in the combination of an endless carrier adapted to revolve the cans, of revolving wipers rotating in contact with the soldered surfaces, a beader or headers with which the cans form contact after leaving the solder bath, to prevent the solder from hardening until after the surplus has been wiped off, supports for retaining the cans in contact with the beating plates as they are advanced to the wipers. It also consists in improvements in the wipers, which are formed with curved elastic arms projecting outwardly from the central hub, having their wiping surfaces composed of suitable flexible fabric so that the rotation of the wipers will force these surfaces yieldingly against the joints which they are to wipe and clean.



WAGON LOADER.—George M. Wallace, Yuba City, Cal. No. 550,426. Dated Nov. 26, 1895. This invention relates to earth-handling machines, variously termed "excavators," "ditch diggers," "levee builders," etc., and because of the special object for which this machine is adapted the inventor has termed it a "wagon loader," by which is meant a machine capable of loading a wagon with dirt, whether in the process of excavating for ditch-making or levee-building or the transportation of dirt from one place to another, to consummate a work either at the beginning or at the end. The machine belongs to those devices in which one of the wheels is a large one and is provided with a series of receptacles adapted to receive the earth from a plow and to raise it to a point above, where it is delivered to the devices by which its final disposition is made. The machine consists, in general, of a carrier wheel having a series of shoe-like pockets or buckets in its periphery, the entrances to which lie in the direction of rotation of the carrier wheel; gates or doors pivotally secured to the wheel on the outer face and adapted to control the discharges of the buckets or pockets, and a means for automatically opening and closing the doors or gates.

GAS GENERATOR.—August Harding, Oakland, Cal., assignor of one-half to the Golden State and Miners' Iron Works of San Francisco, Cal. No. 550,410. Dated Nov. 26, 1895. The object of this device is to furnish a gas supply to the engine, constant and equal in quantity, thereby insuring the proper quality of its mixture with the air drawn in by the engine. The generator consists of a jacketed casing having an inlet and outlet; a shaft in the casing, having radial arms with their outer ends bent to form scoops, whereby the oil is thrown against the inner wall of the casing; a scraper on the shaft, operating directly against the wall of the casing, to provide an equal distribution of the oil; a supply pump having a pipe connected with the inlet of the casing, and a second pump having a pipe connected with the outlet of the casing and having a discharge pipe for the vaporized fluid. This generator is especially useful in connection with that type of explosive engines in which a plurality of cylinders are used, making it important that the supply of the explosive mixture, both in quality and quantity, shall be equal to all the cylinders.

Electrical Progress.

Amalgamator Operated by Electric Motors.

An application of electricity of interest to the mining industry has recently been made in the adaptation of electric motors to the operation of a Bennett amalgamator. The amalgamator consists essentially of the following parts: A truck and frame for supporting the larger part of the machine, arranged to be run forward on a track as the work progresses; a turntable supporting a boom and dipper; the latter two for excavating the dirt, and a revolving cylinder or screen with a hopper, into which the earth is thrown from the revolving screen, the finer material passing through into the amalgamator and the coarser material being discharged at the end of the drum into the tailings carrier. The amalgamator is a large trough in which the finer material, after passing through the screen, is amalgamated. In the bottom of the amalgamator is an agitator which moves backward and forward, keeping the material stirred up well; also a wheel for raising and discharging the fine tailings after the removal of the gold. The four motors used in operating this machine have been supplied by the General Electric Company, and are so constructed as to be thoroughly protected from water or dust. One of these motors is mounted on the frame of the machine betweeu the turntable carrying the cab, and the revolving screen. It is geared to a shaft connected by a sprocket chain to the revolving cylinder, the tailiugs carrier, the agitator in the amalgamator and the wheel for discharging the tailings at the outer end of the amalgamator. A clutch is provided to throw it into gear with the trucks for moving the entire machine backward and forward.

BENNETT AMALGAMATOR OPERATED BY ELECTRIC MOTORS.

The second motor is placed in the cab and operates the dipper by means of a fine wire rope, passing around the drum to which the motor is geared.

The third motor is mounted on the dipper boom and is geared to a drum placed just above it. Fine wire ropes pass around this drum and are attached to both ends of the dipper handle. The dipper may thus be thrust out or in, according to the requirements of the work.

The fourth motor occupies a place in the cab and drives the turntable by means of a beveled gear and large sprocket chain. This motor is also used to swing the dipper boom around from the front of the amalgamator to a position which allows of the dirt being thrown into the hopper of the revolving screen. The motor operating the cylinder, the tailings carrier and the agitator in the amalgamator runs continuously when the machine is in operation, and is provided with a simple starting rheostat only. The other three motors are controlled by reverse rheostats in the cab, and are handled by one man.

M. MOSKOWITZ has a system of electrically lighting railroad trains that is claimed to be practical. He says by it each car in a train can be lighted by the power at present wasted in the friction of the axles, a dynamo being built over the truck, the armature resting directly on the axles. He says a dynamo of 1½ H. P. will "automatically generate electricity after the train attains a speed of ten miles an hour;" that "half of the electricity generated will be conserved by the lights; the rest passes to storage batteries, where, in a run of seven hours, sufficient electricity can be stored to light the car for twelve hours after it has stopped." Some of Mr. Moskowitz's statements appear difficult of consummation.

A New Electric Drill.

Many electric drills have been found too weak for hard rock. A machine has appeared which seems to meet all the requirements of the most exacting drill work. It has been tried in a hard quality of blue and gray limestone, quite seamy, and on that account somewhat difficult to drill. Two sizes of machines were used, the larger size drilling holes 6 to 8 feet iu depth and 2½ inches in diameter, the smaller size, of 1¼ inches diameter, entering about 20 inches. The average performance of the large machine was about 60 feet of hole in teu hours, although the machine has drilled over 100 feet in the same time. The small size drill, which was handled by one man, did, on an average, over 100 feet of 1¼-inch hole in ten hours. No expert help was required in the maintenance of the plant, and the drill runners were paid no higher wages than the ordinary quarrymen. The extreme simplicity and strength of construction of this drill seem to adapt it pre-eminently to mining work. If the drill runner should be careless, and fail to feed the machine up to the rock, no injury can result, as the plunger is automatically cushioned, electrically, in case the stroke becomes too long. Another peculiarity of the machine is that its stroke can be shortened indefinitely. The machiue may be fed up to the rock until the stroke of the plunger is a quarter of an inch or less, but the plunger will work with the same regularity in speed and motion as when running with a full 6 or 8-inch stroke. The lineal feet of 2½-inch holes cut by one of these drills in one year extended three miles. In the same time it excavated 408,000 tons of hard blue and gray limestone rock. The temperature of the air since the drill was operated has ranged between 110° above and 10° below Fahrenheit.

A SIMPLE and effective appliance has been brought out which will be of great service in making knowu the presence of metallic specks in the eye, although its principal use will be in the locating of bullets or pieces of metal in flesh wounds. The device consists of one piece of copper and one of zinc, to which are attached wires leading to a probe. The probe is in two parts, insulated from each other by vulcanized rubber, the distance between the parts be about 1-100 of an inch. The prongs of the probe are inserted in the electrodes of the battery, the copper disk is placed in the mouth between the cheek and teeth, and the zinc disk rests on the tongue, the metals not being allowed to touch. Both hands are then free to use the probe. When the points of the probe touch metal simultaneously the circuit is completed, there is a spark, and at the same moment electricity will be tasted on the zinc. The electrical coudition of some persons is unfavorable to the development of this peculiar taste; in such cases the indication of the contact can be secured by inserting a telephone in the circuit. As soon as the probe touches a bullet or a piece of metal a distinct click will be heard in the telephone. If desired, the metal strips can be placed in a tumbler of water, and the effect will be the same. This probe is being used by the medical profession with great success.

ANSWERS have been filed at Sacramento in the suits brought by the Western Electric Company against the Capitol Telephone and Telegraph Company for alleged infringement of patents. The local company claims to have 530 subscribers, 100 more than the Bell Exchange, and that the suit has been brought for purposes of business embarrassment. The complaining company claim that the Capitol Company has infringed the Firman patent, for an improvement iu the multiple switchboard, and the Watson patent for an arrangement of the switches in the telephone.

THE Union Iron works will build the triple expansion vertical engines for the electrical plant in the new Parrott building on Market street, this city. There will be six 100 K. W. generators and two 30 K. W. generators. It is expected to comprise 350 arc and 5000 incandescent lights. There will also be fifteen electric elevators.

IT will take 2,112,000 feet of copper wire for the power transmission from the San Joaquin to Fresno.

IT is figured that in '95 the aggregate yield of cotton will be 3,500,000,000 lbs.; wheat, 30,000,000,000 lbs.; corn, 78,888,000,000 lbs.; oats, 26,415,808,000 lbs.; rye, 1,516,000,000 lbs.; barley, 3,378,448,000 lbs.; buckwheat, 76,500,000 lbs.; potatoes, 18,000,000,000 lbs.; hay, 100,000,000,000 lbs.; miscellaneous vegetables, rice, tobacco and dairy and pork products, 500,000,000,000 lbs. more; the grain and cotton tonnage may therefore exceed 163,774,756,000 lbs., or 81,887,378 tons in the seven products. The iron and coal and other mining and forest productions may exceed any other year and carry the total production and tonnage of the United States in 1895-96 beyond any figure ever before realized by any country.

Scientific Progress.

Recent Chemical Achievements.

In the Patent Office at Washington are bottles containing colognes and various scents, not made from flowers, but from laboratory compounds, counterfeiting the perfumes of the rose and other kinds of blossoms perfectly. Nearly all of them are entirely new. Attar of roses has not yet been produced artificially, but it is in sight. The ethereal oil that gives to the rose its peculiar fragrance is called rhodonol. This oil is found in the common lemon grass and in geraniums. A slight modification is required to transform it into the attar.

Production of artificial musk from coal tar is another triumph of synthetic chemistry. It is likely to drive the real article out of the market before long. Though not the same thing, chemically speaking, its scent is indistinguishable from that of natural musk. The perfumes of all flowers are due to ethereal oils, and before long all of these will be manufactured artificially. Ethereal oils gives to fruits their delicious flavors. There are hundreds of these oils, and every one of them can be counterfeited easily, inasmuch as they are very simple chemical compounds. It does not pay any longer to use real fruit syrups for soda water, inasmuch as all of them can be imitated to perfection with artificial ethers or by mixtures of ethers.

The biggest commercial success in the way of an artificial flavoring is vanalline. This product is keeping down the price of vanilla beans, and it is likely to drive the latter out of the market. Already the chemists are manufacturing oil of banana, oil of pineapple, oil of pear, oil of apple, oil of raspberry, and many others. The essential oil of banana, obtained by distilling the fruit, is identical chemically with the laboratory product. Oil of banana is a compouud of acetic acid and amyl alcohol, the latter being the chief constituent of fusel oil. Oil of bitter almonds has been counterfeited; though chemically different, it has the same flavor as the real.

The chemists now know how to counterfeit lactic acid, which is the sour principle of sour milk. They also make citric acid, which is the sour of the lemon. A recent achievement of great importance is the manufacture of salicylic acid from carbolic acid. One of the best remedies for gout and rheumatism is salicylic acid; it is also useful as a preservative. Formerly it was obtained from the wintergreen plant and from certain varieties of willows, and was very costly. At present it is made by the ton, and is extremely cheap—too chep, in fact, inasmuch as it is freely employed to give a better keeping quality to bottled and otherwise preserved foods. It kills the bacteria that produce decomposition, but in the stomach it destroys the digestive ferments, and on that account it is injurious to health.

How it is possible to measure wind by its sound has been told by Prof. Carl Barus to the National Academy of Sciences. The whistling of the wind as it crosses a wire varies with the velocity, and this can be computed from the pitch of the note observed in case of a given diameter of wire and for a given air temperature. A special micrometer attachment can be made to convey the sound, isolated from other noises, to the observer at a distance. Every gust and variation of the wind can be studied in this way, and an idea of the direction of the gust

can he had from the sounds obtained from three wires placed at right angles to one another. Micro-aulmometry is the name proposed for observations hy this method.

AT the last meeting of the Technical Society of the Pacific Coast, on the 6th inst., Otto Von Geldern read a paper on an improved theodolite, and exhibited the practical workings of the instrument, which is termed a cyclotome. J. C. Pelton read a paper on "Released Ashlar," arguing the use and beauty of that style of building and showing the manner of arrangement of the hewn and polished stone.

LIQUID AIR is now an article of commerce and is expected to prove of value not only for refrigeration, but as a source of oxygen. Nitrogen is eliminated until the product contains 70 per cent oxygen.

CHALK SLABS are now converted into marble in the workshop hy an imitation of Nature's processes—coloring with mineral stains, and hardening and crystallizing in a suitable hath.

"THE AUTOCAR" is the hest name yet proposed for the horseless carriage.

Mechanical Progress.

Horseless Carriages.

The fact that there were over fifty entries in a recent horseless carriage contest at Chicago shows the widespread interest manifested hy inventors and different motor manufacturers in the event. Many of the vehicles entered never came to the starting post, hecause their inventors relied upon getting more work out of the machines which they proposed to make than they put into them. Among that class may he mentioned the machines run hy coiled springs, expected to rewind themselves going down hill, and various types of cylinders, expected hy their inventors to he cold when nature prescribed that they shall he hot. Gasoline engines, energy derived from storage batteries, compressed gas suhstituted for liquid gasoline, were among the most noticeable.

All the gasoline engines were constructed upon the same principle, though they had each a different measure of success in practical working. In some instances an oil as heavy and uon-inflammable as ordinary kerosene was used. In others, a much lighter and more inflammahle oil has to be used. The oil is first distrihuted in a fine spray in a heated chamber until it hecomes vaporized. It is then mixed with air until the mixture forms an explosive compound, which is set on fire either hy a lighted jet, hy a spark of electricity, or hy the heat of the combustion chamher. In the latter case outside heat has to he applied until the machine has been working long enough to make its contained gases self-igniting. Beyond the explosion chamher is a piston connected hy a rod with the fly-wheel, toothed-wheel, or axle. The machine is arranged so that an explosion occurs when the piston is down the cylinder as far as it will go. The immense expansion of the gases drives the piston violently up to the top of the cylinder, at the same time opening valves for the admission of another supply of air. When the piston returns to the hottom of the cylinder another explosion takes place, with the same result.

This is the principle of an ordinary gas engine using oil as a suhstitute for gas. In a stationary gas engine, however, there is no pressing demand for economy of space, and no lack of water to keep the cylinder as cool as it ought to he in order to get the hest results. To economize space some inventors have suhstituted double cylinders and pistons in place of single ones. They have also so perfected their apparatus that as long as the water which surrounds the cylinder keeps merely at the holling point and does not evaporate so rapidly as to turn into steam as fast as it touches the cylinder, the piston does not choke in the cylinder, and fresh water can he added to the reservoir every few hours. To get rid of jerkiness, inventors have adopted high speed and very small explosions for each revolution. There remains only the smell, which inventors have got rid of hy making the valve for the admission of air large enough to produce perfect combustion. When this is done properly there is no more smell from a galoline engine than from a well-trimmed kerosene lamp.

The motor of a horseless carriage is one part, the revolving and steering mechanism another. If storage hattery cells of any of the common types are used instead of a gasoline motor, the chief difference is in the weight of the cells and in the use of armatures rotating within fixed field magnets to give the motion instead of the crank of a gasoline engine.

The race referred to was run in snow, slush and mud, and won hy the Dureya Wagon Co.'s gasoline motor, on a 108-mile course in ten hours.

The Fort Point Batteries.

Local scientific interest during the week was centered in the official test of the Fort Point hattery (the largest aggregation of dynamite guns in the world) and in the 800 H. P. air compressors which furnished the power. The air test was made last Thursday, and was satisfactory. In the process of compression the air is first compressed to 75 lhs., then to 375 lhs., then to 2000 lbs., or ahout one one-hundred-and-fortieth of its ordinary hulk. The weight of air has often heen tested hy compressing it in receptacles hy the air pump. Elahorate experiments on the weight of air show that one cuhic foot weighs 536 grains, or something less than one and one-quarter ounces. The ahove is reckoned at the surface of the earth, temperature 50° Fahr. Heated air, or air at high elevation, is of course much lighter. This would make a cuhic foot of compressed air in the tweuty-four steel reservoirs at Fort Point weigh 75,040 grains—over ten pounds.

The guns were tested on the following day. They are three in numher, each fifty feet long, fifteen-inch hore, range 7000 yards. Each projectile weighs 1148 pounds and contains 520 pounds of dynamite. Every test was satisfactory and the result in each case exceeded the utmost requirements of the Government inspector. The first shot delivered the shell 3200 yards in nine seconds. The accuracy of the range also was illustrated. The area of the water surface covered is platted on a scale of 100 yards to the inch. By signals and the use of the new hattery 500 pounds of dynamite can be dropped on a vessel attempting to cross any of the surface, the hattery itself heing invisible from any possihle point of attack. The huilding, construction and placing were all done hy local machinists and engineers. It is California work and protects the Golden Gate ahsolutely. The air-compressing machine was constructed hy the Fulton Engineering and Shiphuilding Works of this city.

Solidifying Petroleum.

Paul d'Humy, a French naval engineer, has a method of converting petroleum to a hard mass, suitahle for fuel on hoard large ocean-going boats. It is claimed that this material is affected neither hy heat nor cold, and is absolutely smokeless and odorless. The cakes, when set on fire, hurn only on the surface, and give an intense heat. They require very little draught and make not more than from 2 to 3 per cent of ashes. They can he made in any size or shape, and can he stored anywhere without danger, as they cannot evaporate or cause an explosion. It is stated that a man-of-war having 1000 tons of this solidified oil on hoard could sail around the world or remain at sea for months together. One ton represents thirty tons of coal, and the cost is represented in a French scientific journal at not more than $10 per ton. It is calculated that in the manufacture of steel 500 pounds of solidified petroleum, costing a little over $2, would melt a ton of metal. If half what is said of the new solidified petroleum is true, the way is opened for all sorts of marine possihilities.

THE Bethlehem, Pa., Iron Works has heen awarded hy the Russian Government a contract for the manufacture of nearly 12,000 tons of armor plate, to he used on the new hattleship Bostislav. It calls for 1126 tons of Harveyized armor, and is one of the largest contracts for armor plate awarded hy any nation in recent years.

Practical Information.

THE commercial micas are: Muscovite (white mica), phlogopite (amber mica), hiotite (black mica). Muscovite occurs in greatest quantities in granites and gneiss. Phlogopite is generally associated with magnesian limestone and pyroxenic rocks. Muscovite is used for stove panels. For this purpose it must he clear and free from spots. The hest muscovite is of a ruhy wine color when it hlocks. The white color comes next in value. The sizes of the sheets most desired for commercial purposes are 1½x2 inches up to 8x 10 inches. Phlogopite is used for electrical purposes, and must he smooth, free from wrinkles and crevices. It must split easily, and it must be very flexihle and ahle to stand a very high temperature without disintegrating; dark spots lessen its value. Waste mica is ground and used as a lubricant for heavy hearings, in certain insulating compounds, for decorating wall papers, and as a fertilizer. Scrap mica is made up into large sheets hy a process. Mica is hest mined hy hand, as machinery is more liahle to injure the sheets. The mineral is hlasted, sorted, split to the correct thickness, and then trimmed and packed for the market in paper packages weighing one pound. As a rule, only four per cent is hrought into a marketahle form, so that the waste is enormous.

A SURPRISING discovery has lately heen made in Amsterdam, Holland, of some very old maps made hetween 1705 and 1719, showing the regions in central Africa which have in modern times heen rediscovered hy Livingston and Stanley. The maps are hased on information furnished hy Portuguese traders, and are surprisingly accurate. The course of the Congo river, under another name, is laid down. The maps are accompanied hy writings giving informatiou derived from the blacks of the great lakes which form the sources of the Nile, and which Livingston and Stanley called the Victoria Nyanza. All the modern discoveries were made hy men who did not know that this territory had heen to some extent explored and mapped nearly two centuries hefore. The Zamhesi territory was hetter known to the Portuguese in 1700 than it is to modern discoverers. They had considerahle settlements at the mouth of the Zamhesi river, hut these were overthrown hy wild hordes of blacks, and all trace of them has long since heen lost.

IN ahout twenty-two seconds a drop of hlood goes the round of the hody. In about every two minutes the entire blood in the hody makes the round through the right side of the heart, the lungs, to the left side of the heart, through the arteries, the veins, again to the heart.

THE Schenectady Locomotive Works are using for certain parts what is called "steeled iron," a mixture of 70 per cent good iron and 30 per cent steel, of which the castings ohtained are about 25 per cent greater in strength than common cast iron.

MATHEMATICAL calculations show that an iron ship weighs 27 per cent less than a wooden one, and will carry 115 tons of cargo for every 100 tons carried hy a wooden ship of the same dimensions, and hoth loaded to the same draught of water.

"CRACK PROOF"
PURE RUBBER BOOTS
Are the CHEAPEST because
They are the Most Durable.
They have been used by miners for over Twenty Years. Any one who has worn them will tell you how good they are.
BEWARE OF IMITATIONS.
See that the heels are stamped
"Union India Rubber Co. Crack Proof."

CHEAP IRRIGATION!
UP TO DATE!

SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE
FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten houre' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum hase we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net halance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, hut will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a halance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to aminimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum hase, ¼c per horse power per hour; on domestic coal oil, 1½o per horse power per hour; and on gasoline, 2½c per horse power per hour.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

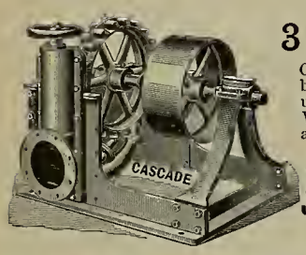
Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address



THE PELTON WATER WHEEL CO.,

121 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

Send for a Pamphlet of either Wheel and write full particulars.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 12, 1895.

Everything is down this week. Silver has dropped to 65¼. In New York the drop is ascribed to the fact that the Chinese indemnity to Japan, which so far as paid was deposited in the Bank of England, has been turned over to the Japanese Government, which, instead of spending it for the purchase of silver for use in Japan, as expected, is now lending it in the London market. This is construed to mean that the money, which was paid in gold, will be expended in Europe, probably in the purchase of warships and material. This is disappointing to London silver speculators, who are now "unloading."

Iron and steel are reported weak in Eastern and Western markets. Manufacturers are unable to induce consumers to believe that now is the best time to buy. In pig iron Philadelphia reports: "Very little business has come to light, notwithstanding a drop in selling prices. The reaction is fast spending its force. Everybody is waiting for bottom to be reached. To-day it looks as if prices must go lower, because production is, in fact, increasing and new orders are rare. The expansion of production was of such dimensions as to demand an extraordinary activity on the part of railroads. There are no signs of improvement in that quarter. The furnace production will overstock the market in a short time at this rate. The bar and sheet mills are buying very moderately. As to future wants, nothing is said or done. No. 1 Foundry is offered at $13.75 and less. The rush has subsided at the foundries, but the larger concerns all look for better things after the new year. No. 2 runs from $12.75 to $13.25. Standard forge is $12 to $12.50; ordinary, $11.75. A lot of low phosphorus sold at furnace this week at $18.25. Brokers' furnace agents admit their recent experience has been unequaled. In some quarters a dread of the future is expressed, but it comes from those interests that must suffer when pig iron production declines below the 200,000 tons per week limit."

R. G. Dunn & Co. report from New York: "The average of all quotations is 8⅛ per cent below the highest point in September, but actual sales are frequently made below quotations. Proposed combination of lake ore producers has not yet been effected and with the fall in the price of iron is less probable. There is more pressure to sell Southern pig here and some large transactions have been made by concessions, while the small demand has broken the harded wire combination, and the two nail and two har associations are now in session to consider their policy. Rails have not changed, while Bessemer pig has declined $5 and billets $6 per ton, and a purchase of 10,000 tons for San Francisco from England is noticed, with a considerable importation of wire nails at Boston. Copper is weaker at 11 cents for lake, with narrow demand, and tin a quarter weaker, with the visible supply here and abroad 29,231 tons, against 22,445 tons a year.

Mining Share Market.

SAN FRANCISCO, Dec. 12, 1895.

The market the past week suffered another shrinkage in values, under the lead, on the down grade, of Hale & Norcross and Occidental. The decline in these two did not create surprise with those informed on the way in which the market is being manipulated, particularly those who have kept informed on the reports of the market as they have appeared from week to week in the MINING AND SCIENTIFIC PRESS. The writer has not allowed an opportunity to pass to impress on traders the absolute necessity of exercising the utmost care in dealing, for, so far as all outward signs go, there does not appear anything to warrant the assertion that strong, moneyed men are in the market. Everything, so far, points to a few outsiders, who are perhaps aided by two or more brokers being in the market. These parties or others of a similar character have, on several different occasions, made like attempts to advance prices, but with dire disaster to dealers who bought in expectation that the long-promised big deal was at hand. While saying this, it must not be understood that the situation at the mines does not warrant a higher range of values, but there is no large combination prepared to back the proposition; and until this does take place, the market is dangerous to operate in. It seems as if the shares in one or two mines are taken up, and, through cross orders and well-circulated bull points, are advanced, and then as suddenly, if not sooner, the market is allowed to give way, carrying the entire list down, but the shares unduly inflated break back the most. This system or way of manipulating, it looks at this writing, is not through with, but what will he taken up next it is hard to say. That others will be taken up is a moral certainty, and that they will let them go off quickly, after an advance has been made, goes without saying. The break in prices was brought about by assessment scares and other hear reports. Fears of assessment are held up to stop any hull movement in the same way that a red flag is displayed to stop a train of cars.

The news from the Comstock mines is uniformly good, and under normal conditions the market value of shares would he considerably higher than at present. In the Alta group the work does not seem to he pushed with that vigor which it was confidently expected it would be, but well informed and conservative mining men think that it could not he done more expeditiously and at the same time to the best interest of shareholders. That the Alta mine is being put in good condition for future work is conceded hy all. In the Gold Hill mines there is no change in the character of the work since last week's report. From all that can he learned, developing work is under way in two or three, while exploiting work is being pushed in the others. This work is towards the west, and therefore quite important. Much of it, probahly, could he dispensed with. It looks as if the superfluous work is being done for the purpose of depleting the cash reserve, and low finances mean assessments. In the very nature of things this procrastination would seem to point to the fact that the outside public hold considerable stock and are willing to pay assessments. So long as they are, there is no doubt of their being accommodated. There are well informed operators who are quite confident that before any large body of ore is shown up market values will rule quite low and the market be greatly depressed. Yet who can tell with certainty, for almost any day the miners' picks may run into ore which may develop into a sufficient body to draw in moneyed men. In Belcher, Seg. Belcher, Crown Point, Yellow Jacket, Challenge, Confidence, Con. Imperial and Alpha the work is heing closely watched, hut it is not expected that anything of very great importance will he struck for some weeks yet. This work is towards the west. In the middle group they are still extracting ore in Potosi and the returns from the milling net a profit. The work being done in these mines is said to he quite important, hut time will he required before results can he fully determined.

In Gould & Curry and Best & Belcher there is no particular change in the situation. In Con. Virginia there is an improving prospect and it is expected that hetter reports will begin to come to hand. The work is being prosecuted on several levels, and in directions which ought to give good results. In Ophir and Mexican there are no changes to note, hut from the character of the work it is thought that the groundwork is being laid for important work to he started next spring. In Sierra Nevada the work attracts some attention, hut experienced miners say it will take considerable time yet before results can be fully determined.

On the Brunswick lode the work is said to he growing in interest at several points, and consequently Occidental is closely watched. While dealers are watching with considerable interest the work under way on that lode, shrewd and well-informed mining men are giving hut little attention to it.

In the outside mining districts nothing of special interest is reported. The work is largely of about the same character as that heretofore reported.

In the Bodie mines the official letters show hut little change from those that have heen written for months past.

The following illustrates the changes of the week:

Assessment Notices.

THE JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the ninth day of November, 1895, an assessment (No. 7) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of December, 1895, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 6th day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 2), of three cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Rooms 37 and 38, Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 16th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office—37 and 38 Crocker Building, San Francisco, California.

CON. CALIFORNIA & VIRGINIA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 22d day of November, 1895, an assessment (No. 5) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the sixteenth (16th) day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

CONFIDENCE SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 13th day of November, 1895, an assessment (No. 26) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 414 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 8th day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. S. GROTH, Secretary.

Office—No. 414 California street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Wm. A. Roberts and John Graham, in the Forest Home mine, Amador county, to impound tailings behind a dam in Arkansas creek; from James T. Ish, in the Bull Neck mine, near Volcano, Amador county, to impound tailings in dry ravines; from Henry Dickerman et al., in the Mill Gulch mine, near Amador, Amador county, to impound tailings behind a dam below the mine; from John G. Ramm, in the Jay Bird mine, near Camptonville, Yuba county, to impound tailings below the mine; from Schillanskey & Co., in the Wild Yankee mine, Shady Run, Placer county, to impound ta lings behind a dam; from Wm. H. Cole, in his mine in Mountain Tp., El Dorado county, to impound tailings behind dams in a dry ravine; from A. B. Jacks and John Clifford, in the Badger Hill mine, near Spanish Ranch, Plumas county, to impound tailings behind a dam in Woods Ravine; from John Schafer, in the Pine Leaf mine, near Spanish Ranch, Plumas county, to impound tailings in an old pit; from Geo. C. Sargent, in the Gold Hill mine, Nevada county, to impound tailing on a flat south of Deer Creek; from James Meehan, in his mine near Aqueduct City, Amador county, to impound tailings below the mine; from J. N. Flindt, in the Trafton mine, near Yankee Jims, Placer county, to impound tailings below the mine; and from George W. Smith, in the Gold Hill mine, near Oleta, Amador county, Cal., to impound tailings behind a dam in a ravine—gives notice that a meeting will be held at Room No. 32, Flood Building, San Francisco, Cal., on Dec. 23rd, 1895, at 1:30 P. M.

ANNUAL MEETING.—THE REGULAR ANNUAL MEETING of the stockholders of the Gould & Curry Silver Mining Company will be held at the office of the company, room 69, Nevada Block, 309 Montgomery street, San Francisco, California, on MONDAY, the 16th day of December, 1895, at the hour of one o'clock, P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer hooks will close on Friday, December 13, 1895, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

SPECIAL MEETING.—A SPECIAL MEETING of the stockholders of the Sonora Extended Mining Corporation will be held at the office of the company, 213 Jackson street, San Francisco, California, on MONDAY, the 30th day of December, 1895 to consider and order on an offer to purchase the plant of the mine and other property of the corporation, and to authorize and empower the directors to sell the same, and to execute or cause to be executed a proper deed of conveyance of said property to the purchaser.

JOHN METCALFE, President.

The Boom Gold Mines.

These mines, fully developed, giving high grade, free milling gold, with all the machinery, mill, buildings, water, must now be sold for a song, to raise money for private purposes. Maps, reports of engineers at command; title clear; no misrepresentation. Investment positively safe. Everything new and complete. Correspondence desired that means strictly business. A splendid chance for a small investment.

CHARLES F. KUHNEN,
Casa Grande, A. T

The California Stump Puller.

The possibility of securing desirable open land on the Pacific slope is yearly narrowing; and, in about the same ratio, there comes a demand for some practicable method of removing trees and stumps from land otherwise valueless, in order that it may be cultivated or placed upon the market.

Right here the "California Stump Puller" comes in with a reputation acquired by several years' practical use, extending through Washington, Oregon, California, Central America and the Sandwich Islands. Though the machine has been subjected to the severest tests under the most trying conditions, it has always come out victorious. For immense pulling capacity, embraced in simple, compact and safe form, adapted to all the irregular conditions of mountainous or level land, this machine has probably no equal.

Numerous unsolicited testimonials are in the hands of the manufacturer, evincing the entire satisfaction the machine has given. The cost is low, and considering the service rendered, the cost would be low at any price. Full details of the stump puller will be found in the illustrated catalogue, and also valuable hints in regard to clearing land generally. Address A. Barnes, General Manager, 82 and 84 Zoe St., San Francisco. See the advertisement on another page. *

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows

Name.	No. Cert.	No. Shares.	Amt.

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on November 2, 1895, the above sale is postponed to MONDAY, the 2d day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on December 2, 1895, the above assessment is postponed to TUESDAY, the 31st day of December, 1895, at the same place and time of day.

W. W SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

F. A. HUNTINGTON'S NEW IMPROVED
Centrifugal Roller Quartz Mill.
This Improved Mill has the following advantages over my Geared Mills, viz:
1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.
2d.—I dispense with gearing and drive direct from the pulley.
3d.—There are five less places to oil.
4th.—The Mill is built much heavier and stronger than the former ones.
5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

The Chicago Drainage Canal.

The greatest engineering work now being done in the United States is the Chicago drainage canal, costing $30,000,000. Primarily a drainage channel, it will be also a ship canal for vessels drawing twenty-two feet. Work began September 3rd, 1892; it is to be completed April 30th, 1896. Some of the items are striking. Of glacial drift and solid rock 39,547,499 cubic yards are to be excavated. This "glacial drift," of which there are 27,246,656 cubic yards, overlies the solid rock to an average depth of twenty-five feet, and is harder to work than the rock. Pebbles and boulders are cemented together with earth and clay, and after being undermined and blasted the strongest manganese steel tools are quickly dulled and destroyed. After considerable costly experiments McArthur Bros., contractors on this section, after blasting put steam shovels to work in cuts lengthwise of the section, each successive cut going deeper toward the underlying rock. Cars are run on parallel tracks to the steam shovel on a higher level till the bottom cut is reached, when the track is placed on a level with the shovel track. A traveliug cableway plays an important part in the work, and is very economical, saving considerable expense in blasting and quickly and cheaply moving the material. Fig. 1 shows a completed rock cut on section 8, and gives an idea of the cableway referred to. The span is 700 feet; the head tower, on the right, is 93 feet high; the tail tower, on the left, 73 feet. The main cable is of steel, two and one-quarter inches diameter, the other ropes large enough to handle an eight-ton load. An auxiliary rope dumps the skip without stopping the onward movement of the carriage on the cable. The towers are moved by small reversible engines. The cableway has a daily capacity of 600 cubic yards. Its total operating cost is from $15 to $18 per day. Twenty such cableways as that illustrated are in use on the canal.

FIG. 1.—COMPLETED ROCK CUT ON CHICAGO DRAINAGE CANAL.

Fig. 2 shows the manner of building retaining walls. The quarry is located in the canal; two traveling derricks are used, following up the work as the canal is opened. The wall on each side is laid by derricks of similar construction, located in the canal and traveling along the wall as the work progresses. The stone is taken to the traveling derricks on a track running parallel to the wall. The mortar is mixed in a berme near each derrick. The average height of the completed wall is eighteen feet. Wall building is the only part of work that cannot be carried on in freezing weather. The wall is founded on surface one foot below grade, built with batter to make top two feet farther than bottom line from center of canal; face stones not less than 12 nor more than 30 inches thick, laid on their natural quarry beds, equal parts sand and cement. In the quarry each derrick requires engineer, foremau, seven quarrymen and two stonecutters; each derrick on the wall takes an engineer, foreman, five masons, three helpers, two derrick men, two hod carriers, two mortar mixers, two sand mixers and two laborers. The above data is compiled from a description of "Contractors' Methods Employed on the Great Chicago Drainage Canal" by the Lidgerwood Manufacturing Co., 96 Liberty street, New York, to whom we are also indebted for the two accompanying illustrations.

IT is difficult to understand what useful purpose is served hy the singular action of Congressman McLachlan of the Sixth Congressional district of this State, who has at this late day introduced into the House of Representatives a bill suspending for the year 1895 that portion of the Federal Statutes requiring the annual expenditure of at least $100 in work or improvements on each unpatented miuing claim in the United States. But ten days of this year remain, and presumahly ninety-nine-hundredths of such required work is now done, so that even could such a hill he rushed through the Committee on Mines and Mining, secure immediate passage, he agreed to by the Senate, pass that hody and receive the President's signature, its passage would afford no relief. Such legislation would he manifestly unjust to the thousands of miners who in all the States and Territories have in good faith (many of them being poorly able to afford it) done the required amount of work necessary to legally hold their claims. To he fair and equitable, such a measure should pass earlier in the year. In '93 the suspension-of-assessment act became a law in November; in '94 in July, thus giving all an opportunity of profiting, if they desired, by its provisions. To wait till the last days of the year to which it is iutended to apply is grossly out of place. Its passage can help nohody and would simply put a present premium on sloth, delay, carelessness and fraud. It would also result next year in the general impressiou among miners and prospectors that there was no need to pay attention to the law; that along in the closing days of the year would come a relief bill iu Congress making such work unnecessary, and that it was optioual with the holder if any improvement or developing were done on any unpatented mining claim. The expediency of the measure in general was widely discussed two years ago. The majority of opinion is now against it. More letters have been received on this suhject by the MINING AND SCIENTIFIC PRESS this year than on any other general topic. It was generally supposed when the 53rd Congress adjourned that there would be no suspension of the Statute for this year, and on the strength of that supposition the law has beeu generally complied with. While buncombe is prohahly allowable even among Congressmen, it would work less mischief if applied in some other direction than that taken hy one of our California legislators in introducing and pressing the measure referred to. It is to be hoped that some one on the Miues and Mining Committee will see the absurdity of the proposition and squelch it in the committee room.

State Mineral Lands and Pending Legislation Thereon.

Herewith is published in full the official text of the "compromise" Mineral Lands bill adopted by the Executive Committee of the Miners' Association on December 12th, and of the bill originally reported by the Legislative Committee on November 27th, generally referred to as the "Idaho-Montana bill." The latter is substantially the same as the hill introduced in Congress by Congressman Caminetti in January, 1895, aud which failed to pass the House hecause of the single objection of Congressman Hephurn of Iowa, at the most critical time in its history. It is the same as the act now in operation in the States of Idaho and Montana, where its results are most heneficent and satisfactory. It will be noted that it suspends the patenting of all lands within the limits of the railroad grants until they can he examined and classified by a commission as to their being mineral or uon-mineral in character. The expenses fall ou the Government, where they helong.

Where no protests are filed, the classification reported by the commission is final upon approval of the Secretary of the Interior. Where protests are filed against the classification made by the commission, ample provision is made for protest and hearing in the land office. The machinery of this bill is simple, and the Congressmen from the States to which it applies are loud in praise of its working. It is said that twenty-five per cent of the lands examined have heen saved to the miners, nearly all of which would have been absorbed by the railroads without this hill. Giveu an able and scrupulous commission, the operation of such a bill applied to California would he all that could he asked.

We are informed, however, by the ageuts of the land department of the Southeru Pacific Company that the bill is a failure. We have noticed, however, that this charge comes from no other source.

The old Mineral Lands Committee, composed of Messrs. Ricketts, Wright, Yale, Loftus and Hoffman, expended much of their efforts toward having the provisions of this bill made to apply to California, first by their support of Mr. Camiuctti in his effort to pass the hill in Congress, and afterward in their attempts to induce the railroad company to consent to adopt its provisions as the basis of the agreement so long under negotiation.

The Miners' Executive Committee may do well to remember that the work of the old Mineral Lands Committee *was approved by the Association in the convention at Pioneer Hall in this city last month.* This approval is a demonstration that the association desires the bill presented to Congress to be similar to the Idaho-Montaua act. Following is the bill that would be of benefit to the California miner, but which has been rejected:

A BILL TO PROVIDE FOR THE EXAMINATION AND CLASSIFICATION OF CERTAIN MINERAL LANDS IN THE STATE OF CALIFORNIA.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

SECTION 1. That the Secretary of the Interior be, and he is herehy, authorized and directed, as speedily as practicahle, to cause all unpatented lands in the State of California, within the land grant and indemnity land grant limits of the Central Pacific Railroad Company, as defined hy an act of Congress entitled, "An act to aid in the construction of a railroad and telegraph line from the Missouri river to the Pacific ocean, and to secure to the Government the use of the same for postal, military and other purposes," approved July first, eighteen hundred and sixty-two, and acts supplemental and amendatory thereof; and of the Western Pacific Railroad Company, as defined by an act of Congress entitled, "An act to amend an act entitled, 'An act to aid in the construction of a railroad and telegraph line from the Missouri river to the Pacific ocean, and to secure to the Government the use of the same for postal, military and other purposes,' approved July first, eighteen hundred and sixty-two, and to amend an act amendatory thereof, approved July second, eigbteen hundred and sixty-four," approved March third, eighteen hundred and sixty-five, and acts supplemental and amendatory thereof; and of the California and Oregon Railroad Company, as defined hy an act of Congress entitled, "An act granting lands to aid in the construction of a railroad and telegraph line from the Central Pacific Railroad, in California, to Portland, in Oregon," approved July twenty-fifth, eighteen hundred and sixty-six, and acts supplemental to and amendatory thereof; and of the Atlantic and Pacific Railroad Company, and of the Southern Pacific Railroad Company, as defined hy an act of Congress entitled, "An act granting lands to aid in the construction of a railroad and telegraph line from the States of Missouri and Arkansas to the Pacific coast," approved July twenty-seventh, eighteen hundred and sixty-six, and acts supplemental to and amendatory thereof; to he examined and classified by Commissioners to he appointed as hereinafter provided, with special reference to the mineral or non-mineral character of such lands, and to reject, cancel and disallow any and all claims or filings heretofore made, or which may hereafter he made, by or on hehalf of the said Central Pacific Railroad Company, or said Western Pacific Railroad Company, or said California and Oregon Railroad Company, or said Atlantic and Pacific Railroad Company, or said Southern Pacific Railroad Company, on any unpatented lands in said State of California, which upon examination shall he classified, as provided in this act, as mineral lands.

SEC. 2. That, for the purpose of making the examination herein provided for, there shall be appointed hy the President of the United States, as soon as practicahle after the passage of this act, three Commissioners, each of whom shall he a resident of the State of California, at least one of whom shall he a practical miner, and not more than two of whom shall he appointed from the same political party; and said persons so appointed shall constitute a Board of Commissioners to perform within such State the duties herein prescrihed. Before entering upon their duties each of said Commissioners shall take an oath to faithfully perform the duties of his office. The oath of office of said Commissioners shall be filed by them in the office of the Commissioner of the General Land Office. Said Commissioners shall receive for their compensation their actual traveling and other expenses incurred while in the performance of their official duties, and, in addition thereto, the further sum of ten dollars for each day they may he actually engaged in the performance of their duties; and their accounts shall be audited hy the Secretary of the Interior and paid monthly. Said Commissioners shall make examination of the lands herein mentioned, and may also take the testimony of witnesses as to the mineral or non-mineral character of any of said lands, and receive any other evidence relating to said matter, and shall have power to summon witnesses to appear hefore them, and to administer oaths; and they shall, immediately upon their appointment, proceed to examine and classify the lands herein mentioned, within said State of California, as provided in this act. All testimony taken hy said Commissioners shall be reduced to writing, subscrihed hy the witnesses, and filed with the report of the Commissioners hereafter required. The action or decisiou of a majority of said Commissioners shall control in all matters herein provided for.

SEC. 3. That all unpatented lands in said grants shall be classified and taken to he mineral lands under this act which have, or probably will bave, a market value by reason of the minerals which they contain, or which show such indications of deposits of valuahle minerals as would induce a miner to spend bis time or money upon tbem with the reasonahle expectation of finding mineral in paying quantities; or which, from their geological formation, or location in a well-defined mineral belt, or their situation or propinquity or relation to known mineral lands, are, or probahly will he, valuahle for the mineral therein; and all these matters shall be considered hy the Commissioners in determining the miueral or non-mineral character of such lands, and in classifying the same. The classification herein provided for shall he by sections, where tho land has heen surveyed, unless there are such differences in the situation or character of different parts of the same section as in the opinion of the Commissioners to require its classification by legal subdivisions. If the lands examined are not surveyed, classification shall he made hy tracts of such extent, and designated by such natural or artificial boundaries to identify them, as the Commissioners may determine. Where patents have heretofore issued for mining ground in any section of land, this shall he taken as *prima facie* evidence that the forty-acre subdivision within which it is located is mineral land; *provided*, that the word "mineral," where it occurs in this act, shall not be held to include iron or coal: *and provided, further*, that the examination and classification of lands herehy authorized shall he made without reference or regard to any previous examination or report or classification thereof.

SEC. 4. That such of the lands herein mentioned as have been surveyed prior to the passage of this act shall he first examined and classified as herein provided, and afterwards, and as speedily as practicahle, the lands herein mentioned which have not heen surveyed, until all the lands herein mentioned have heen examined and classified as herein provided.

SEC. 5. That said Commissioners shall, on or hefore the fifth day of each month, file in the office of the Register and Receiver of the Land Office of the land district, in which the land examined and classified is situated, a full report, in duplicate, in such form as the Secretary of the Interior may prescribe, showing all lands examined hy them during the preceding month, and specifying clearly, by legal subdivisions, where the land is surveyed, or otherwise, by natural objects or permanent monuments to identify the same, the lands classified hy them as mineral lands and those classified as non-mineral; and with said report shall he filed all testimony taken and written, communications received hy said Commissioners, relating to the lands embraced in the report. The Register and Receiver shall file one duplicate of said report in their office, together with all accompanying testimony and papers, and the other duplicate shall he, by them, forwarded direct to the Secretary of the Interior; and said Commissioners shall furnish to the Secretary of the Interior, at any time, such further or additional report or information as he may require, concerning any matters relating to their duties or the performance of the same. Upon receipt of such report, the Register of the Land Office shall, at the expense of the United States, cause to he published, in a newspaper of general circulatiou in each county in which the land so classified is located, at least once a week for four consecutive weeks, notice of the classification of lands as shown hy said report; and any person, corporation or company feeling aggrieved hy such classification may, at any time within sixty days after the first publication of said notice, file with the Register and Receiver of the Land Office a verified protest against the acceptance of said classification, which protest shall set forth in concise language the grounds of objection to the classification as to the particular land in said protest described, whereupon a hearing shall he ordered hy, and conducted before, the said Register and Receiver, under rules and regulations as nearly as practicahle in conformity with the rules and practice of such Land Office in contests involving the mineral or non-mineral character of land in other cases; and an appeal from the decision of the Register and Receiver shall he allowed to the Commissioner of the General Land Office and to the Secretary of the Interior, under such rules and regulations as the Secretary of the Interior may prescrihe; *provided*, that at such hearings the United States District Attorney, or his assistants for the judicial district in which the land is situated, shall appear and defend the interests of the United States, and for such services he shall receive compensation not exceeding fifteen dollars per day for each day's actual services before the Register and Receiver, to he paid out of the fund provided for the examination and classification of said mineral lands.

SEC. 6. That as to the lands against the classification whereof no protest shall have heen filed, as hereiubefore provided, the classification, when approved hy the Secretary of the Interior, shall be considered final, except iu case of fraud, and all plats and records of the local and general land offices shall be made to conform to such classification; and as to the lands against the classification whereof protests may he filed, the final ruling made after the day set for hearing shall determine the proper classification, and all records of the local and general land offices shall he made to conform to the classification as determined hy such final ruling, and all costs of such hearing shall he paid hy the unsuccessful party, under such rules as the Secretary of the Interior may prescrihe; and the Secretary of the Interior is herehy authorized to establish such rules and regulations as may he necessary to carry into

effect the true intent and provisions of this act as speedily as practicable.

SEC. 7. That no patent or other evidence of title shall be issued or delivered to said Central Pacific Railroad Company, or to said Western Pacific Railroad Company, or to said California and Oregon Railroad Company, or to said Atlantic and Pacific Railroad Company, or to said Southern Pacific Railroad Company, for any land in said State until the examination and classification provided for in this act shall have been made, and such patent or other evidence of title shall only issue then to such land, if any, in said State as any of said companies may be, by law and compliance therewith, and by the said classification, entitled to; and any patent, certificate or record of selection, or other evidence of title or right to possession of any land in said State, issued, entered or delivered to said Central Pacific Railroad Company, or to said Western Pacific Railroad Company, or to said California and Oregon Railroad Company, or to said Atlantic and Pacific Railroad Company, or to said Southern Pacific Railroad Company, in violation of the provisions of this act, shall be void; *provided*, that nothing contained in this act shall be taken or construed as recognizing or confirming any grant of land or the right to any land in the said Central Pacific Railroad Company, or in the said Western Pacific Railroad Company, or in the said California and Oregon Railroad Company, or in the said Atlantic and Pacific Railroad Company, or in the said Southern Pacific Railroad Company, or as waiving or in any wise affecting any right on the part of the United States against the said Central Pacific Railroad Company, or the said Western Pacific Railroad Company, or the said California and Oregon Railroad Company, or the said Atlantic and Pacific Railroad Company, or the said Southern Pacific Railroad Company, to claim a forfeiture of any land grant heretofore made to any of said companies.

SEC. 8. That there is hereby appropriated, out of any money in the treasury not otherwise appropriated, the sum of twenty thousand dollars, or so much thereof as may be necessary, to be expended to carry into effect the provisions of this act, the same to be paid out upon the order of the Secretary of the Interior; and the Secretary of the Interior is hereby required to embrace, in the annual estimates submitted to Congress for appropriations for the Interior Department, a sufficient sum to pay the said Commissioners for the fiscal year next ensuing, and annually thereafter until the classification of lands required by this act has been fully accomplished.

The "Compromise" bill adopted by the Executive Committee is a very different affair. Here are its provisions:

AN ACT TO PROVIDE FOR ASCERTAINING AND DETERMINING THE CHARACTER OF CERTAIN LANDS IN THE STATE OF CALIFORNIA.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

SECTION 1. That the Secretary of the Interior be, and he hereby is, authorized and directed, as speedily as practicable, to ascertain and determine the character, whether mineral or non-mineral, of all the surveyed odd-numbered sections of unpatented land in California lying within the primary and indemnity limits of the grants made by Congress on July 1, 1862, and July 2, 1864, to the Central Pacific Railroad Company of California, and the Western Pacific Railroad Company; on July 25, 1866, to the California and Oregon Railroad Company; and on July 27, 1866, and March 3, 1871, to the Southern Pacific Railroad Company, in the manner hereinafter provided; and as rapidly as the unsurveyed lands within the limits above designated are surveyed, in accordance with the law governing the United States public land surveys, the character, whether mineral or non-mineral, of the odd-numbered sections thereof shall, in like manner, be ascertained and determined.

SEC. 2. As soon as practicable the Secretary of the Interior shall publish a notice containing a list of all the surveyed lands hereinbefore mentioned, described by legal subdivisions, and informing all persons that they may, within thirty days after the completion of the publication of such notice, file with the Register and Receiver of the land district, wherein such land may be situated, a protest against the patenting of any of such land to the Railroad Company within the limits of whose grant such land may be; and a similar notice shall thereafter, and in like manner, be published with reference to the unsurveyed lands in the preceding section described as rapidly as the same shall have been surveyed, in accordance with the law governing the United States public land surveys.

Said notice shall be published at least once a week for a period of sixty days in some newspaper of general circulation, to be designated by the Secretary of the Interior, in each county wherein are situated any of the lands above mentioned; but such notice need not be published in any county wherein there is not published a newspaper of general circulation. Such notice shall also, during said period of publication, be posted in a conspicuous place in the land office for each land district wherein any of such lands are situated.

SEC. 3. During the period of such publication of said notice, or within thirty days thereafter, any person may file with the Register and Receiver a verified protest against the patenting of any of the lands described therein, which protest must particularly describe the lands protested, by sections, or by legal subdivisions thereof, and must set forth the nature and extent of the lands known or believed to be valuable for the mineral therein contained, and must fully set forth in detail the facts upon which such knowledge or belief is founded, together with the names and postoffice addresses of any persons claiming or interested in such mineral lands, if known to the contestant.

SEC. 4. That, at the expiration of the period above limited for the filing of protests, the Register and Receiver shall forward duly certified copies of all protests filed to the Secretary of the Interior, who shall thereupon suspend the issuance of patents as to all lands against which protests have been filed in time, manner and substance as in the last preceding section provided; and no lands so suspended shall be patented to any railroad company until, if at all, after the non-mineral character thereof shall have been established by a preponderance of proof in the manner hereinafter provided.

SEC. 5. As soon as practicable after receiving such protests, the Secretary of the Interior shall cause hearings to be held before the Registers and Receivers of the proper local land offices as to the mineral or non-mineral character of all the lands as to which the issuance of patents has been suspended in accordance with section four of this Act. Notice of such hearings shall be served on each protestant, and shall also be published at least once a week for four successive weeks in some newspaper of general circulation, to be designated by the Secretary of the Interior, in each county wherein are situated any of the lands affected by such notice; but such notice need not be published in any county wherein there is not published a newspaper of general circulation. Such notice shall also, during the period of its publication, be posted in a conspicuous place in the land office wherein such hearing is to be had.

For the purpose of facilitating the hearings herein provided for, the President of the United States shall appoint an attorney, residing in the land district in which the hearing is to be had, to appear and maintain the mineral character of all the lands subject of the hearing; and all final decisions, rendered in pursuance of such hearings, shall be forever conclusive, except in cases of fraud. And the President of the United States shall also appoint three commissioners in each land district in which any lands covered by such protests are situated, each of whom shall be a resident of the State of California, and at least one of whom shall be a practical miner, whose duty it shall be to inspect all the lands about which hearings are ordered, and to testify as witnesses to all the facts which they have ascertained respecting the mineral or non-mineral character of the lands which they have examined; and such commissioners may also procure the attendance of other persons as witnesses at such hearings, and may introduce any other competent evidence as to the character of the lands on trial. Before entering upon their duties, each of said commissioners shall take and subscribe an oath to faithfully perform the duties of his office, which oath shall be filed with the Commissioner of the General Land Office.

That at such hearings evidence may be introduced by any person interested to show that any of such lands have, or probably will have, a market value by reason of the minerals which they contain; or that they show such indications of deposits of valuable minerals as would induce a miner to spend his time or money upon them with the reasonable expectation of finding mineral in paying quantities; or that such lands, from their geological formation, or location in a well-defined mineral belt, or their situation or propinquity or relation to known mineral lands, are, or probably will be, valuable for the minerals therein; and all these matters shall be considered in determining the mineral or non-mineral character of such lands, and in classifying the same. The classification herein provided for shall be by sections, unless there are such differences in the situation or character of different parts of the same section as require its classification by legal subdivisions thereof.

Where patents have heretofore issued for mining ground in any section of land, this shall be taken as *prima facie* evidence that the forty-acre subdivision within which it is located is mineral land; *provided*, that the word "mineral," where it occurs in this act, shall not be held to include iron or coal; *and provided, further*, that the classification of lands hereby authorized shall not be controlled by any previous examination or report or classification thereof; *and provided, also*, that appeals shall be allowed from the decisions of the Register and Receiver to the Commissioner of the General Land Office, and to the Secretary of the Interior, under such rules and regulations as the Secretary of the Interior may prescribe.

SEC. 6. That each of said Commissioners shall receive his traveling expenses and ten dollars for each day he is actually engaged in the performance of his duties, and the accounts of said Commissioners shall be audited by the Secretary of the Interior, and paid monthly; and each attorney so appointed by the President of the United States shall receive his reasonable traveling expenses from his place of residence to the United States Land Office, which he is required to attend, and return, and fifteen dollars for each day he is actually engaged in the performance of his duties, and his accounts shall be audited by the Secretary of the Interior, and paid monthly.

And it is further provided that all publications herein provided for, and the cost of reporting the testimony given and evidence presented by the said Commissioners, and the *per diem* and expenses of the Commissioners and Attorneys, shall be paid out of the fund hereinafter provided for.

SEC. 7. That there is hereby appropriated out of any money in the Treasury not otherwise appropriated the sum of twenty thousand dollars, or so much thereof as may be necessary, to be expended to carry into effect the provisions of this act, the same to be paid out upon the order of the Secretary of the Interior; and the Secretary of the Interior is hereby required to embrace in the annual estimates submitted to Congress, for appropriations for the Interior Department, a sufficient sum to pay the said Commissioners, Attorneys and expenses for the fiscal year next ensuing, and annually thereafter until the classification of lands required by this act has been fully accomplished.

There are two radical defects in this last bill which will prevent it from ever being of any practical benefit to the mining interest.

The first is seen in Section 2, which substantially provides that a list of all the railroad lands must be published at once and that no protest will be considered unless filed within three months from the date of the first publication. This means that the whole vast area must be critically examined by agents of the Miners' Association within three months—something manifestly impossible.

Inasmuch as the Miners' Association has no organization nor funds for such a purpose, it is at least remarkable that any representative of the miners should consent to such an arrangement. It would seem that the railroad people are trying to make use of the Miners' Association to further a grab, which the miners would be simply helpless to oppose.

The second defect is shown in Sections 3 and 4, which must be read in the light of the decision of Secretary Smith on the Benjamin protests in order to be fully understood.

Section 3 provides that a "protest must particularly describe the land protested by sections, or legal subdivisions thereof, and must set forth the nature and exteut of the land known or believed to be valuable for the mineral therein contained; and must fully set forth in detail the facts upon which such knowledge or belief is founded, etc." Section 4 should alone prevent the passage of the bill, viewed from the standpoint of the miner. To go into detail on this point is probably unnecessary to those who can understand it and useless to those who can not.

Section 4 provides that upon receipt of such protest the issuance of patents shall be suspended "as to all lands against which protests have been filed in time, manner and substance as in the last preceding section provided." It cannot be ascertained, by the closest investigation of Sections 3 and 4, what matter of "substance" must be considered sufficient by the Secretary for the allowance of a protest. And as the bill furnishes no new rule, there can be no question that the Secretary will continue to follow the rules of July 9, 1894, and his former interpretations thereof. These interpretations are in effect that general protests will not be received, no protest being allowed excepting in cases of individual claimants after a mineral discovery.

The whole purpose of this mineral lands agitation is thus set at naught.

There can be no question in the minds of those who have watched the course of proceedings that, should the bill pass, the whole batch of general protests which might be filed under its provisions would be swept aside by an omnibus decision which would leave the lands free from obstruction to patent by the railroad.

If anything could be more satisfactory to the corporations, it is hard to conceive what it might be.

In October, '94, this journal pointed out the evil effects to the mining industry of this State of the procedure adopted by the Secretary of the Interior and the probable corporate absorption of much of the mineral area of the State unless the manifest move was checked. The Miners' Convention the next month took the matter up and created a special committee which vigorously opposed such encroachment and checked the swift and silent absorption that had begun. The question received the widest attention; it was personally brought to the cognizance of every public official including the President of the United States, and each promised to see that justice was done. Journals here and elsewhere susceptible to corporate influence attacked the movement, its motives and, at last, under evident instruction assailed the mining industry of the State. Difference of opinion arose in the Executive Committee, but public opinion was so manifestly imbued with a correct understanding of the matter that any attempt to subdue or sidetrack the movement was unavailing. In the recent convention the committee's work was endorsed and unanimously ordered continued.

Justice to itself and to the cause it represents impels this journal to protest against the passage "in the name of the miners of California" of the bill adopted by the Executive Committee on the 12th inst.

It has been said, "Well, if we can't get all we want, let us take what we can get." Read the last bill, printed on this page, and see what the miners "get:" nothing. It is a travesty on justice; it is a good Southern Pacific bill, but it will not keep one acre of California's mineral area from the hands of those who seek to acquire it unjustly. It is not pleasant to be obliged to say this, but it is the truth. We impugn no one's motives; doubtless the gentlemen who framed this measure, and who voted for its adoption, believed sincerely it is the best that could be done, and in the only shape possible of passage, but better pass no bill at all than for the miners of California, in or out of convention, to stultify themselves by endorsing a piece of proposed legislation that defeats the very object it ostensibly is meant to secure.

W. V. TOMKINS, of Prescott, Ark., William Harrison, Georgetown, Ga., and F. M. Leonard, Libby, Mont., are the members of the mineral land commission for the Missoula district of Montana. They report that they have inspected and passed upon 303,270 acres of land this season. Gentlemen in and out of the Executive Committee of the California Miners' Association who are told that the labors of the commission have been "unsatisfactory" might, possibly, modify that opinion by reading the report or communicating with either of the above-named commissioners.

THE Northern Pacific Railroad Co has announced that it will make no more opposition to any Montana mineral land protests where the protested sections include bona fide mining property. This will no doubt be a surprise to the gentlemen in California who assure us that the Montana mineral land act, which has been in operation in that State during the year is a failure and unsatisfactory. It has accomplished its object to retain the unpatented mineral area of Montana to the miner. As to its being "unsatisfactory," so much depends upon the point of view.

Notes on Gold Milling in California.

NUMBER VI.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

The Discharge is next arranged. This is the distance between the top of the new dies and the lower edge of the screen, and to fix the right distance is of importance. The greater the height of the discharge, the greater will be the proportionate amount of pulp and slime, and they also will be retained longer in the mortar. The quantity of amalgam retained in the mortar is also proportionately greater. A low discharge calls for a coarser screen, and naturally results in a larger output of the battery, and with a larger proportion of outside plate amalgam. With a *constant* height of the screen, the natural wear of the die increases the height of the discharge. For ordinary iron shoes and dies, and average rock, the wear of the die is roughly estimated from ¾ to 1 lb. of iron per ton of ore crushed. To counteract the effect of this wear on the discharge height, different sized chock-blocks or screen-frames are supplied; the highest being used with new dies, and later replaced by lower ones, thus holding the distance more even than the use of a single size would permit. In some mills, when the dies are worn down, an iron plate, made for the purpose, is laid beneath them to raise them up.

As a very high discharge, besides creating much slime, beats up a larger portion of the gold into float gold than would be the case with low discharge, the choice necessarily influences the gold recovery; this is more particularly the case, if the ore carries any appreciable amount of valuable sulphurets. The discharge varies in the different mills from 4 inches to 10 inches, the average being from 6 inches to 7 inches.

Screens.—In fastening the screen to the screen-frame, care must be observed to get it on smooth, without any wrinkling or buckling. Tin screens must have the tin burned off before fastening to the frame; it is also well to expose the Russian-iron screens to a quick fire of shavings, to burn off the oil with which they are more or less faced. The edges of the screen are tacked to the frames, and are faced with strips of blanket to make a close connection with the mortar. In fastening a wire-cloth screen, to get it on smooth, a good method is to tack it first along the lower edge, then draw it up tight and even over the upper edge, and nail it before cutting if off the roll. As previously stated, brass-wire screens should not be used in conjunction with cyanide of potassium, as the brass becomes coated and clogged with amalgam. The screen-frame with screen is dropped into the grooves cast on the outside of the mortar discharge, and fastened solid with iron wedges—two vertical (one for each groove) and a horizontal one in the center of the lower lip. The wedges should have a broad head, to facilitate knocking them out. After the screen has been fastened in place, a piece of canvas or a board should be hung in front to arrest the outward throw of the pulp from the drop of the stamp, and direct it in an even flow onto the plates beneath. In some mills this board is giving a slope towards the screen, and has an amalgamated plate screwed on, which receives the splash. Bolted to the front of the modern mortars is a frame to carry the outside battery-plate and a distributing-box, a few inches above the apron-table on which it discharges.

When everything is ready to drop the stamps, the self-feeder is rolled to its place, the cam-shaft is set to revolving slowly, the water is turned into the battery, and the millman, standing on the platform above, grasps the hand-hold of the first finger or prop and introduces, with the other hand, the cam-stick between the tappet and the revolving cam; by this means the weight of the stamp is taken off the prop, which is pulled back and rested against the edge of the platform. This operation is repeated with each stamp until all are working. To carry out this operation when the shaft is revolving rapidly, without injuring the operator's hands, requires practice. The cam-stick mentioned above consists of a peice of wood about 2½ feet long, 1 inch thick at the point, running up to 2½ inches near the handle, and faced with strap-iron or a strip of belting. It may also be made entirely of strips of belting, 2 inches or 3 inches wide nailed over each other and attached to a wooden handle. To hang up the stamps, the hand-hold is grasped, the knee pressed to the latch-finger, and the cam-stick introduced between cam and tappet as before, and the latch-finger pushed under the tappet.

Before dropping the stems the face of the cams should be tightly lubricated, for which purpose axle grease or specially prepared compounds are used; a very useful one is a mixture of graphite and molasses; in some mills, to avoide the use of grease, the face of the cam is rubbed with a bar of common soap.

Grease.—It being essential, for good amalgamation, that the presence of grease be avoided in the battery, care must be observed in lubricating the cams, the stems where passing through the guides, and the shaft bearings. In many mills, trays made from old oil-cans are fastened beneath the bearings, cloth aprons are tacked from the underside of the guides to the floor above; rings of rubber packing or old belting also encircle the stems at the lower edges of the guides. The millman should diligently wipe off the stems and any part of the battery frame, where the presence of grease is indicated, at least once during a shift. Grease in the mortar is indicated by a black, dirty appearance of the surface of the plates, as also by the adhesion of more than the usual proportion of the amalgam to the iron castings inside the mortar. The usual remedy is to shut off a part of the battery water, for a short time, while adding a lye solution; or to add fine wood ashes to the ore.

The Amount of Water Required for the proper working of the battery depends on the nature of the ore; clayey ores, or such as have a high percentage of sulphurets, requiring the most; but while in the former case a greater amount is needed inside the mortar, the latter condition permits a part being added outside the screen, on the lip of the mortar. A small sluice-box, with plug-holes, is placed across the front in this case, or the water is conveyed by means of a half-inch perforated iron pipe, attached to the vertical supply pipe by an elbow joint, permitting it to be turned either way as required. "The amount of water used per ton of ore stamped varies from 1,000 to 2,400 gallons, with a mean amount of about 1,800 gallons per ton of rock crushed." Most of the mills in actual practice figure roughly on one miner's inch of water, more or less, per twenty-four hours for each battery of five stamps. To obtain the largest amount of crushing of clean quartz from a battery, only sufficient water should be used inside to keep up the regular, even swash of the pulp, and if that be not sufficient to keep the plates on the outside clear from accumulating pulp, more may be added outside the screen. The pulp, in passing down over the apron-plate, should roll in successive waves, corresponding to the back and forth wave-motion inside the battery, rather than flow in an even sheet, as affording a better opportunity of contact for the particles of amalgam.

Where the temperature falls low in winter, arrangements should be made to deliver the water in a tepid condition, as better amalgamating results will be obtained, through keeping the quicksilver in a lively condition. Where steam power is used, this can be easily arranged; but when using water power, a separate heater is required.

Feeding.—Hand-feeding has become nearly obsolete in California. It is only practiced in small concerns; or where a temporary mill has been put up for prospecting purposes. The advantages of a machine-fed mill are numerous; the chief of these are (1) that the wear of the iron of the shoes and dies is less and more even-faced; (2) that from 15% to 20% more ore can be crushed in a given time; and (3) that the labor expenses are reduced. The machines should be carefully gauged and watched to insure a steady, low feeding of the stamps. In order to insure a good splash in the mortar attention must be given to the succession in which the stamps are made to drop. A good splash is one that shows a wave passing along the lower edge of the screen, moving backward and forward from end to end, or a similar wave-motion that has its initial point from the center stamp. The succession most frequently adopted in California is 3, 5, 1, 4, 2; 1, 5, 2, 4, 3; 1, 3, 5, 2, 4, and 1, 4, 2, 5, 3; the last spreads the pulp very evenly from end to end. The greatest amount of discharge is obtained, apparently, by dropping the center stamp first; while the most crushing is done, other conditions being equal, by dropping the end ones first. Any arrangement of the stamps will answer, however, that distributes the pulp evenly and discharges it well.

The Apron should be set immediately in front of the mortar, but independent of the battery-frame, to exempt it from the jar of the stamps; it should be arranged to permit of the grade being easily altered if necessary. The size, shape, and grade of the apron-plates differ widely, depending largely on the the millman's preferences and experience. The usual form of the apron is rectangular, of the width of the discharge, and any length desired, but usually from four feet to twelve feet, forming a level (transversely), smooth surface, set on a grade varying from one-half inch to two and one-half inches to the foot. Sometimes the surface is divided by steps, with or without distributing-boxes. These are usually from one inch to two inches. The apron should never be drawn in at the lower end, for reasons given further on; and the steps should not be too deep, as otherwise the plate next to the drop will show mostly bare copper through scouring.

On examining a plate that is in use under good working conditions, it will appear that the upper portion, immediately below the mortar, say for a distance of eighteen inches, carries at least 75% of all the amalgam caught on the apron, the largest accumulation showing along the line of impingement next the lip of the mortar. Now if the apron-plate were discontinued at about two feet, and continued again on a lower level of about two inches, a second line of accumulation would result, naturally on a smaller scale; hence, the advantage of the step form. Another advantage in this style of apron, if that by fastening these sections to the table by means of wooden buttons on the sides instead of cleats and screws, and having one extra plate on hand, the scraping and dressing of the same can be performed at any time, without stopping the crushing of the stamps, by removing the plate and substituting the extra one.

The grade of the apron-plate should be such as to keep the surface clear from any pulp accumulations, but not steep enough to obtain a scouring action. It will depend on the coarseness of the pulp, the nature of the gold, the amount of water available, and the percentage and nature of the sulphurets. Where a battery-plate is in use above the apron, it is usually given a grade of from one and one-half inches to two inches to the foot. Grades for the apron proper vary from one-half inch to two and one-half inches to the foot, but the average is about one and one-fourth. The apron-plates are usually silver-plated copper plates, which have largely superseded the copper amalgamated plate of former days—chiefly on account of the readiness with which the former plates do their full duty from the first starting, which is not the case with the copper plate; also, on account of their freedom from discoloration by oxidation. If silvered plates be used when running a very low-grade ore, the plating soon wears off, requiring a replating about every six months. The usual amount of silver put on plates is one ounce to the square foot. The usual thickness of copper plates is one-sixteenth inch to one-eighth inch. In preparing them for amalgamation they should first be carefully heated to a black heat, and plunged into cold water, which makes them soft and more ready to take up quicksilver. They are then scoured bright with fine tailings-sand, moistened with some cyanide of potassium and applied with a block of wood; then dressed all over with a weak solution of nitric acid, or with cyanide of potassium and quicksilver, with sodium amalgam sprinkled over and brushed or rubbed into the surface. Before final use, it is well to give them a coating of fine gold amalgam; or, if not convenient, silver amalgam will answer. In using the cyanide of potassium solution, care must be taken not to use it too strong, especially if the quicksilver is not applied to the plate immediately, otherwise a coating is formed on the surface that will not take up the quicksilver. Where the ore is of a fair grade, after a long period of continuous use the plate will have absorbed an amount of gold that will not yield to scraping unless the plate is immersed in boiling water for a time before being scraped, or heated over a fire and hammered with a mallet on the reverse side, in which case care must be taken not to dent the plate.

As the saving of amalgam on the apron and sluice-plates is largely a matter of gravity, the conditions under which the pulp passes over the plates should conform to the laws pertaining to the falling of a body through a moving liquid medium; hence the proper shape of the apron, and the flow and consistency of the pulp, should be well considered. If, as was formerly the almost universal custom, the lower end of the apron be contracted (and in numerous cases this contraction was as great as four to one), the depth of the pulp spread over the surface of the plate increases as it passes down; the flow of the water across a given section becomes uneven, forming at the sides a swirl, along the edge of which, sand is precipitated, covering and rendering that portion of the plate useless, from its inability to come in contact with the particles of amalgam, while producing scouring currents at other parts. The proper method is to spread the flow over a wider surface as it passes from one plate to the other, and lessen the grade, which may require an addition of clear water.

This contraction of the plates is made to this day in most of the mills, when connecting with the sluice-plates. The liquid pulp, starting with a width equal to that of the mortar-discharge, is made to pass over sluice-plates from one foot to two and one-half feet in width; hence, the comparatively small percentage of amalgam obtained from them. The only condition under which narrow plates are permissible, is where, previous to receiving the pulp, a certain amount of the solid matter has been diverted. Where all the pulp goes from the plates to concentrators, the latter become an important factor in regulating the amount of water turned into the battery. The feed-water required for concentrators of the vanner types is from one to two gallons per minute.

(*To be Continued.*)

* Bulletin No. 6, California State Mining Bureau.

A NEW METHOD of manufacturing illuminating gas from coal dust consists in allowing the coal to enter in a continuous stream a retort heated from the outside, by means of feeding apparatus in the top of the retort.

Notes on Certain Water-Worn Vein Specimens.*

By F. C. HOLMAN, San Francisco, Cal.

It is desired in these notes to record a vein phenomenon certainly unique in the writer's limited experience, and, as it seems to him, sufficiently rare to be worthy of mention.

In the little mining camp of Forhestown, situated in the Sierra Nevada of California, it was announced one day, when the miners of the Gold Banks mine came off shift, that "washed gravel" had been struck on the 265-foot level. To those acquainted with that section and the character of the mine (a gold-bearing quartz vein) this was a somewhat startling announcement; for, prolific as the State is, we are not in the habit of mixing up promiscuously our vein and placer deposits. However, the statement proved to have some foundation.

The mine is located at an altitude of about 2700 feet, on the brink of one of the great canyons of erosion characteristic of the drainage of this range. A lateral ravine cuts the vein at right angles, thus making its general strike approximately parallel to the canyon at this point, and with a variable dip of from 20 to 40 degrees towards the canyon. The strong, well-defined vein, often twenty feet wide and more, presents nothing to distinguish it particularly from scores of others in the State, unless it be considered peculiar in the highly crystalline character of its quartz and the nature of the enclosing country rock, which is metamorphic in the extreme, very hard, devoid of lamination, and in bedding so obscure that it might easily pass—at least on superficial examination—for one of the basic eruptives. Near by in the district can be found a series of slates common to the gold belt of this range, and within the limit of the company's property is an intrusion of an acid eruptive. On an adjoining claim a granite shows itself. The mine is opened through an inclined shaft sunk on the vein. The ore carries both free gold and sulphurets, the greater part of its value being in the latter. For a California gold ore, the amount of silver is unusually high. The vein being very compact and the quartz highly crystalline, the mining of the ore is by no means easy. Except at the immediate surface, no oxidized ore is found. Vugs are numerous, furnishing large and perfect crystals, and it is with one of these cavities that we have to deal.

It was opened into on the roof and side of the 265-foot level; irregular, chimney-like and of such size—running upwards on the dip of the vein for a rod or more—as to permit one easily to crawl into it. It gradually closed in at both ends. Unfortunately, the work going on in this part of the mine made it impracticable for a visitor to trace the continuation of this cavity (if any existed) in either direction, or to form a more thorough idea of its immediate surroundings. The foreman said it could be traced to the level above, 100 feet.

As far as it was possible to judge, the vein at this point was in its original condition, with solid quartz on all sides of the vug, and no evidence that the vein had been fissured or broken up by any movement of the walls since the deposition of the quartz. There was no water coming in on this level and very little on the level above.

The sides and roof of this cavity were beautifully studded with crystals, many of them large and perfect, while on the inclined bottom was a mass of loose quartz debris. Generally scattered over the bottom, the deposit increased in quantity towards the lower end. It comprised both amorphous and crystalline material, single broken crystals and clusters. While most of this material was rather fine, the majority of the pieces being under three inches on any dimension, coarser stuff was mixed with it, some of the latter masses, which had evidently fallen from the roof or sides, being slab-like in their proportions and suggestive of a crustified deposit in process of formation.

While the loose stuff furnished plenty of pieces not defaced further than by simple fracture, a large proportion of it showed evidences of attrition in all degrees, from the crystal with only the apex and edges slightly smoothed off to the rounded, translucent pebble, such as any water course or sea beach might produce. Admitting a preliminary fracturing, a close examination of the specimens leaves little room to believe that any other agency than that of mechanical abrasion in a stream of water will account for their later reduced condition. The wearing down of the most obtrusive points and the corresponding protection which others, less exposed, have received; the irregular effect in the same specimen of a rough grinding here and a polishing there; the accumulation of fine quartz particles and dust in the cavities among the crystals; these alone, without other considerations, would seem to establish sufficiently the fact of this agency.

There has been a current of water during the formation of this ore body that in its velocity departed very materially from the slow percolation usually associated with the genesis of ore deposits of this kind. To which of several causes the fracturing is to be ascribed is not so evident. It looks as if the violent action of the water might be responsible for some of it. If not wholly due to this cause, the balance must be charged to the account of a movement in the walls of the fissure, or to gravity acting in the simple form of masses falling from the roof, a few feet to the floor, but not through the buoyant medium of water. Besides the crystals that have been both broken and eroded, many showed no signs of the latter effect, and while some of these might have been recently broken in mining, the evidence of fracturing by natural causes is both too apparent and abundant to allow this possible human agency to have any bearing of importance. One, at least, of the main factors in reducing some of these masses to their present size must have been coarse material rubbing upon itself; and the force of the stream that could perform the work of moving some of the larger pieces, the entire superficial areas of which have suffered by erosion, must have been considerable. Nor could the appearance of these specimens be the result of a long-continued impact of fine material, acting on the principle of the sand blast.

Take, for example, a translucent specimen weighing nineteen and one-half ounces avoirdupois, of an approximate elliptical section, five and one-half inches long, three inches wide and one and one-half inches at its greatest thickness. From its original form it must have lost, at a low estimate, at least its present weight. Its present rather smooth surface has outlined upon it the bases of numerous large crystals, irregular hexagonal polygons and other cross sections depending upon the positions occupied by the crystals. While smooth, it is not polished, excepting an occasional small facet-like face where a body in contact by long-continued action has reduced the rougher surface. Such little areas are distinguishable from unaltered portions of crystal surfaces. Most of the crystals have been left with a rough surface; but in others polishing has followed, producing the appearance which a clear crystal has when its edges have been rounded off by solution.

Iron and copper pyrites in small crystals are found in the specimens, and partake of the same general effects as their harder surrounding matrix.

Equally interesting with the fact of attrition is that of deposition as displayed in a very thin coating of iron sulphide upon the eroded surfaces. As a coating, it is too minutely crystallized to allow its form to be made out under an ordinary glass; but it has in appearance nothing in common with the older and coarser deposition of iron pyrites, contemporaneous with the quartz. Very firmly attached, it is present on all of the larger specimens in patches, and must have been widely deposited in the chamber upon the debris; and its absence on parts of these same pieces can clearly be ascribed to erosion, all the phases of which are as plainly shown on this metallic coating as upon the underlying eroded quartz surface.

Here, then, in a large fissure vein, along one of the closing channels of its formation through which circulated waters carrying the vein-forming material—quartz and its accompanying sulphides—mechanical work has been performed by a current under sufficient intensity of pressure to grind quartz upon itself. The solid worn masses and the diminution in their size, and in the size of large crystals (particularly such as are imbedded and exposed along the plane of the major axis, so that they could have lost but little, if any, by fracturing) tend, with other details, to show a prolonged action or a violent one, or some combination of the two. It is hard to conceive of a current horn of the deep circulation as responsible for this case. Yet if the erosion is a phenomenon of the vadose circulation, as seems probable, so also is the secondary deposit of sulphide, and we are forced to accept somewhat peculiar attending conditions to account for it. It would be a case of mineralization by the two circulations at the same point, a considerable distance below the surface; the metallic sulphides being drawn from two distinct sources of supply, far removed from each other. Except in limestone regions and certain other formations, a stream pouring directly into a fissure depositing and eroding alternately is not commonly displayed in the shallow circulation. Furthermore, the erosion was not chemical, but mechanical.

Other accessories to the fact must be allowed: an oscillation in the stream to permit two such antagonistic forces to act; a sufficient supply of organic matter to reduce the oxidized products of other veins, carried in solution; an open channel and free exit somewhere for such a volume of water. The present topography of the country on the strike of the vein does not suggest that any such opening, offering the required difference in level, existed; and it would be necessary to look for an outlet in a cross fissure at right angles leading into the present drainage.

Such an assumption will, of course, require, for the age of this erosion and secondary deposition of mineral, a very late geological date, subsequent to the cutting down of the country and the formation of the canyon and its drainage system.

* Read at the Atlanta meeting of the American Institute of Mining Engineers, October, 1895.

Ancient Quartz Mining.

Written for the MINING AND SCIENTIFIC PRESS by I. B. STORCH, M. E.

The time of the discovery of gold is unknown, but manufacturing of gold jewelry can be traced by the oldest historical records, even back to biblical traditions. The oldest gold mines worked by people, of which no history, no traditions exist, great mines, the ruins of which were discovered by the explorer, Manch, in 1871, are situated near the ruins of Zimbabye, South Africa, believed to be the famous Ophir of King Solomon. These gold mines are undoubtedly the oldest known to the memory of man.

The first memorandum about gold mining has been discovered among the papers of the Grecian writer, Diodorus, 400 before Christ: "On the boundary line of Egypt there are certain dominions, full of developed gold mines, being worked by a large number of people deported there by the kings of Egypt," etc.

The first authentic description of mining for gold by the ancient Egyptians and Nubians was published by the Grecian historian, Agatharchides, 200 before Christ, stating that the auriferous rock underground is loosened by fire, and then broken by hand into smaller pieces, finally stamped, washed and smelted.

Mining was conducted by an experienced miner, who prospected the ground, and when a gold cropping was found, set the men at work, who simply had to follow the irregular course and the threads of the ore as long as it lasted; no deadwork was done, and as soon as the ore was dug out the hole was deserted and work was commenced on a new discovery.

The different kinds of work were divided among the laborers according to intelligence, age and strength; professional skill was not wanted, except for washing the pulp. The laborers were recruited from notorious criminals, prisoners of war, their families and even their descendants, all were claimed, and had to work day and night, twenty hours out of twenty-four, being watched by soldiers, foreigners who spoke another language, so that understanding and conversation among them was impossible. No care was taken of them; if well or sick or crippled they were driven to work like a band of cattle, cursed and cruelly beaten by their overseers, until they broke down. Men of best age and full power were placed underground, to break down the ore, sink inclines, etc. They had a light fastened on their forehead, and their only tool was a kind of sledge. Children of both sexes packed the ore to the surface, and there it was received and transported by feeble old men to the stamp mill, and stamped to small gravel size by selected men of thirty years of age. A ram of deep mortar holes cut into the rock wall near the mouth of the mine replaced the battery of present times, and the rock was stamped by hand with light iron stamps. Small grinding mills were erected at the nearest creek or brook, and the grinding stones were turned by hand. Only women were employed to grind the hard quartz to fine pulp, and the writer says: "It was the most pitiful sight—the poor creatures, half-starved, naked skeletons, enveloped in a thick cloud of poisonous dust; death was preferable to their miserable life."

The pulp was then spread on tables, a little inclined, and by skillful hands washed, so that the heavier gold separated from the lighter gangue. The finishing touch was performed with soft sponges, by dotting out the last particles of sand. The gold was then gathered and melted in clay crucibles. The smelter used for fluxing lead, salt, a little tin, and bran, and it took five days and nights heavy and continuous firing to get the bullion.

This mode of mining was conducted for nearly 2000 years, with hardly any improvements. Amalgamation was found in operation first in South America in 1557.

THE screw-thread on railroad track bolts is usually cut by forcing them into a die or matrix and rotating them slowly. The method greatly weakens the metal. A Pittsburg concern is now making the thread by pressure only, the bolt remaining cold during the operation. By this method the threaded portion of a bolt having a ¾-inch shank is given a diameter of 13-16. The blank part of this bolt will break, it is claimed, before the threaded portion.

A BIG concern in Waterbury, Conn., now makes buttons consisting of a thin aluminum shell filled with plaster of Paris.

Concentrates.

PECK BROS.' new mill at Empire, Nevada, is completed.

A SEVEN-FOOT VEIN of $20 ore is reported on the 200 level of the Bodie.

THE Alaska-Treadwell Company talks of putting in a pneumatic locomotive.

VICTOR, COLO., with 2000 people, has two daily newspapers and a stock exchange.

THE Silver Peak, Nevada, leaching works are reported shut down for lack of cyanide.

SEVENTY-FIVE BARRELS of whiskey await transportation at Hawthorne, Nev., to Bodie, Cal.

EIGHT MILLION DOLLARS is the estimated gold output of Cripple Creek, Colo., district for 1895.

IT is stated that if anything is a failure so far at Kennedy, Nev., it is not the mines themselves.

SOUTHERN OREGON miners purpose meeting at Grant's Pass, January 6, 1896, to form a miners' association.

BASIN, Mont., people expect to hear next week of the sale of the Hope mine to New York men for $900,000.

A TRAIL CREEK, B. C., man writes: "Locating claims has now been succeeded by considerable development work."

A CHECK in favor of J. Ryan, drawn by Mountain Mines Co., on the Bank of Shasta, awaits ownership in this office.

DR. LATHAM of this city and J. C. Conklin of Salt Lake have bonded twelve claims three miles west of Mercur, Utah.

THE Johanneshurg, South Africa, *Star* says "the retailer of water at six pence per bucket is doing splendid business."

THE Cripple Creek, Colorado, *Mail* of the 14th inst. contains applications for U. S. patents for 148 different mining locations.

LAST week's rains have enabled several Sierra foothill mines to resume work, and miners and farmers are alike happy.

THE November output of the Seven Thirty mine at Georgetown, Col., was over 20,000 ounces of silver and 27,000 pounds of lead.

ON the 30th inst. the Horn Silver mine will pay a $50,000 dividend, the first since last March, making a total to date of $5,080,000.

SHASTA now talks of electric lights, the power and illumination to come from the Iron Mountain smelter, located two miles from there.

THE hullion statement of the Ontario, Utah, mine shows a production of 66,129 fine ounces silver for the four weeks ending December 7th.

THE Park View Mining Company, at Crevasse, Mont., will construct a five-mile flume early next season, and a 100-stamp mill will he placed in operation.

GLOBE, Arizona, papers hear of a probable reduction of wages there to $2.50 per day, owing to the large number of men arriving there seeking employment.

THE recent mineral statistics published herein regarding several Pacific Coast States and Territories were mainly compiled from the annual report of the Director of the Mint.

FOR the past eleven months the fees of the Colorado Secretary of State have amounted to $50,000, most of which came from the incorporators of new Cripple Creek mining companies.

E. H. DICKEY and John McNiel of Salt Lake City. Utah, have hought the Mechanics' mine, near Sutter Creek, Cal.. for $20,000. A hoisting plant is to he erected and other work hegun.

THE Ontario Mill and Mining Company has incorporated; capital stock, $96,000; place of husiness, San Jose, Cal.; objects of the company to carry on a general milling and mining husiness.

GEORGE LOVELOCK, of Lovelocks, Nev., has disposed of the White Cloud Copper mines in northern Churchill, near the Humboldt line, to an Eastern company for $29,000. The money has been paid him.

THE elaterite recently discovered in Carbon Co., Utah, is being worked. It will be sent to Berlin, Germany, where it commands $125 per too, the purchasers paying all freight charges; 550 sacks are now ready.

THE Virginia City *Enterprise* claims the best authority for the statement that as soon as the Hale & Norcross suit is settled every mill on the Carson river will commence working the low-grade ores of the Comstock.

AN old British mining company—Cook's Kitchen—recently winding up its affairs testified that its superintendent had worked ten hours every day in the year for forty-two years, and gave him £150 as a testimonial.

CONTINUED cessation of silver mining has occasioned many idle miners, and consequently an immense amount of prospecting for gold, resulting in its discovery in many districts where, hitherto, its presence was unnoted.

THE Colorado-Oregon Mining Company has incorporated in Oregon. S. J. Ross, O. J. Ross, J. T. Ritchie of Colorado, incorporators; capital stock, $1,000,000: principal office. Denver, Colorado; Oregon hranch office, Baker City, Or.

THE *Democrat* says the ore heing milled at the Virtue mine does not average $8 per ton, yet a twenty-five days' run there produced $22,000, and argues for the establishment at Baker City, Or., of a custom mill and sampling works.

THE Georgetown, Colorado, *Courier* says: "The capital stock engaged in mining in El Paso county would well nigh pay the national debt." Oue day's incorporations last week gave an aggregate "capital stock" of $12,175,000.

THE Old Ironsides Mining Co. has incorporated at Spokane, Wash.; capital, $1,000,000: J. P. Graves, H. P. Palmerston. The Ben Lummon Gold Mining Co. has also incorporated there; capital, $2,500,000: L. M. Boardman, J. S. Parker.

IT's a little late, and Josephine Co., Oregon, should have heen heard from four weeks ago, hut Dudley Smith, of Glenwood Springs, Colorado, comes up with the statement that he found a gold nugget in the craw of a turkey last week.

THE Takon group of mining claims in Silver Bow Basin, Alaska, have heen sold to W. E. Ehner for $40,000. The group consists of seven claims, and embraces a ten-stamp mill, flumes, tramway and right to 2000 inches of water from Gold creek.

IN this city last week were incorporated the Pioneer Gold Mining Co.; capital stock, $2,000,000; directors, J. Barton, J. Curry, L. F. Reichling, G. Goodhan, T. Boyson; and the Sumdun Chief Mining Co.; capital stock, $500,000; directors, J. Cross, A. H. Winn, H. G. Stevenson, E. L. Jeffrey, W. H. Payson.

SECRETARY OF THE INTERIOR SMITH declares that a patent for a mining claim may issue upon the application of a company, though the location of said claim he made hy an individual in whom the possessory right remains, where it is shown that in fact said location was made for and in behalf of said company.

AN Idaho paper reports the discovery of a Montana gold field which, it is alleged, will produce $132,000,000 "in the first vertical 100 feet," "$1,320,000,000 in the first 1000 feet," "$2,640,000,000 in the second 1000 feet," and so on. While the figures in the Idaho compositor's case hold out there need he no limit to the matter.

WHATEVER the numher of veins within the surface lines of a claim, the location must he hased on some one vein. Though at the time of location a shaft has not been sunk to the discovery of mineral in place, yet, if this is done afterwards, and hefore the rights of others have attached, the discovery will relate back to the location.

ACCORDING to a recent decision of the Oregon Supreme Court, picking rock from the walls of a shaft or outcropping of a ledge and testing it in order to find a paying vein cannot be credited as part of the $100 worth of "work and improvement" required to he made by a locator on his claim within one year from the date of his location.

ACCORDING to the Cripple Creek *Mail*, D. H. Moffat and Eben Smith, two Denver hankers, are negotiating with the Scotch owners of the MacArthur-Forrest cyanide process for a controlling interest in the patents in the United States. An offer was made some weeks ago and accepted by the foreign owners, hut the sale bas not heen completed.

TALKING of Rhodesia, where he is now actively engaged, Capt. Jefferson Clarke says: "The formation is such as to lead me to believe that the reefs are all fissures. At any rate, the formation is a correct one to find fissure veins in, and I helieve that, with the proper work of development, these reefs will he found to be of that nature."

THE Register and Receiver of the U. S. Land Office at Redding publish a notice in the Yreka *Union* of the Central Pacific Railroad Company's intention to apply for patents on a large area of land in Siskiyou county, principally in the mining sections, and all protests or contests must be filed in the Land Office within sixty days, or hefore February 12th, 1896.

MINING TERMS local in their nature are not unusual. The current numher to hand of the Australian *Mining Standard* has an article on "Bottoming Duffers." To a California miner that is not suggestive of any meaning. Our transpacific contemporary uses it as a convenient term to indicate the proof hy sinking that certain ground wasn't worth working.

APPLICATION is made at Newark, N. J., for a receiver for the Enterprise Mining Company, incorporated under the laws of New Jersey, with a capital of $2,500,000. The property and mines are situated in Rico, Colorado. The company was incorporated in 1890. It has paid $825,000 in dividends. During the past two years no dividends have heen declared, it heing impossihle to work the mines at a profit.

DESPITE all attempts at "profound secrecy," the owners of the property permit it to he known that io Mendosa, South America, have heen discovered gold quartz mines, "the ore from which assays thirty-five ounces to the ton." The information is further vouchsafed that "coal and water are near hy, and the ore is free milling." The combination would appear to be irresistihle.

FOLLOWING are recent Washington State mining iocorporations: The Puget Sound Iron and Steel Works of Tacoma; capital stock, $30,000; J. L. Roherts, A. Lister, A. C. Marconnier. Red Hill Mining & Smelting Company of Spokane; capital, $1,000,000; W. W. D. Turner, J. W. Wentworth, D. W. Henley. The Royal Canadian Gold Mining Company of Seattle; capital, $500,000; S. G. Simpson, J. H. Woolery, E. J. Powers.

THE right to mine can only he given on puhlic lands. When land becomes individual property the Government loses control of it entirely. If patent issues for agricultural lands on which there is a known lode, title to the lode does not pass. The same rule applies to known placer ground. But if a patent is granted hefore the mineral character of the ground is estahlished, it is not open to contest and the title passes from the Government.

IT is argued in these closing weeks of '95 that another mining "hoom" is due. 'Tis now nearly fifteen years since there was any abnormal development in the industry of huying and selling mining shares. As for the husiness of mining, there has heen considerahle of a "hoom" in that since the panic of '93 made gold mining the most profitahle of any avocation, and since the development of electrical industries created such an enormous demand for copper.

SECRETARY HOKE SMITH has approved grants to the Oregon and California Railroad Company, 23,947 acres in the Rosehurg and Oregon City land districts, Oregon; 167,991 acres in the Rosehurg land district; 58,396 acres to the Central Pacific Railroad Company in the Redding district; 32,968 acres to the Oregon Central Railroad Company in the Oregon City district; and 3539 acres to the Southern Pacific Railroad Company in the San Francisco and Visalia land district.

THE London mining papers tell the following, which may he true; it is of Barney Barnato. A country parson wrote to him: "My aim has always heen investment, not speculation. When your hank came out I regarded its shares as an investment and purchased 400 of them at £4, sinking my little all in them, and a good deal more. They have now fallen to £2, and I am undone. I cannot face my parish as a hankrupt, and what am I to do? I throw myself upon your mercy." Barnato was deeply moved by the appeal, and replied that he would buy back the shares at £4. On receipt of tbis reply the guileless parson wired to his hrokers to "huy 400 shares of Barnato hank stock at £2 and send them around to Barnato Brothers, who will give you £4 for them."

THE owners of the Yakima group and Cumberland mine, Slocan district, B. C., have organized two companies to work these properties. The one to work the Yakima group is called the Sunshine Mining Company, and the one to work the Cumherland is called the Cumherland Mining Company. Each company's capital is $500,000, and hoth have the same officers, namely, W. H. Yawkey, president; N. D. Moore, vice-president and manager; W. C. Yawkey, secretary and treasurer. Head office of hoth companies, Three Forks, B. C.

A CHICAGO paper says: The estahlishment of a Mining Stock Exchange in Chicago is now an assured fact. The scope of enterprise has heen broadened so as to include not only mines of all descriptions, hut mineral products. Cripple Creek and other mining shares will constitute hut a small part of the business of the hoard. Negotiations have already heen entered into for the listing of Michigan copper mining stocks, which are now extensively traded in on the Boston Exchange. Montana, California, Utah and Alaska mines will he reported.

THE United States Treasury Department has prepared a statement of specie exports from the Pacific coast ports for Novemher, as compared with the same period in 1894. Silver bars, $738,548, a decrease of $231,052; Mexican dollars, $1,455,586, an increase of $1,001,441; South American dollars, $3000, a decrease of $16,400; silver coins, $29,500, an increase of $10,973; gold, $491,002, a decrease of $263,297. In eleven months the silver shipments from the Pacific coast to Hongkong and other Chinese and Japanese markets have heen over $16,500,000 against $12,000,000 last year. This accounts for the small shipments of silver from London to the Eastern markets.

THE Philadelphia and Reading Coal and Iron Company is preparing to introduce new methods of mining coal in its pitching veins in the Schuylkill region. Hereafter the slopes, which have been in use during the last thirty or forty years, will he done away with and big shafts suhstituted. The first of these shafts is about to he sunk on the tract of the Potts colliery at Locustdale, and will be a vertical opening of at least 900 yards in depth. It is claimed that this shaft will revolutionize the methods of coal mining in the extensive Schuylkill region, as the methods of slopes now in use become too hazardous and expensive when driveu over a depth of four lifts, or 600 yards. The Reading officials will attempt, at the same time, to continue the old Bast colliery slope 1,400 feet deeper, in order to tap the basin, hut in the future shafting will he used.

THE case of the Spokane Falls and Northern Railroad Co. against the Paris Belle Mining Co. is on trial in Victoria. The Paris Belle mineral claim was located on ground in the edge of the town of Rossland, which was included in the grant of lands made by the Canadian Government to the railroad company in consideration of their building the Nelson and Fort Sheppard Railway. The question to he determined is what rights could he acquired under a mineral location made on granted land. The Paris Belle Co. contend not only for mineral rights, hut surface rights as well. If the surface rights are granted the ground hecomes valuahle for town property. There are several mineral claims of this class there. If they all carry surface rights there would he little townsite left for the railroad company.

AS INTIMATED in these two columns two weeks ago, a hill has heen introduced into the House "for the relief of the California miner." It was introduced on the 17th hy Congressman McLachlan aod provides for the suspension of the assessment clause for '95, the same way that it was suspended in '94 and '93. It is ridiculous to introduce such a bill now. No miner wants it; even if he did, it is too late to be effective. The result of its passage would he to put a premium on lethargy and punish those who in good faith did their assessment work for '95 hy making it easier to delay and more profitahle not to comply with the law, in hopes of final relief in the closing days of the year. Should this mistaken measure pass, it will result in no assessment work heing done in '96, in the expectation that in the final weeks of the year similar legislation will make it unnecessary.

FOR the months of June, July. August, Septemher and Octoher, '95, the Alaska-Treadwell Co. show an aggregate result as follows: Bullion sold, $3.68 per ton of ore, $427,197; total expenses, mining 116,290 tons, forty-eight cents, $56,335.44; milling 116,290 tons (1992 tons concentrates), twenty-nine cents, $32,254.59; chlorination, 1998 tons treated, eleven cents, $13,162.77; general expenses Douglas Island, eleven cents, $12,544.06; general expenses San Francisco, two cents, $2311.20; general expenses Loudon office, one cent, $985; hullion freights and charges, five ceots—$1.07, $5597.63; constructioo, $151.86—$124,342.55; net profit realized, $2.61—$303,028.58; cost of roasting and chlorinating, $6.59 per ton of concentrates. The costs per ton were lower and the profits greater than for any other similar period in the history of the company, which has earned in these five months more than its regular annual dividends. Beside the regular quarterly dividend of 37½ cents per share, the company will pay an extra bonus dividend of $100,000 on the 23rd.

TELLURIUM is said to he recently discovered in Cripple Creek, Colorado. It is one of the rarest of metals, has heen found in small quantities in this State and in Colorado, in combination with the gold ore, to which it is almost always allied. It is also reported in paying quantities at Long Lake, near Midway, B. C. A prospector, hy access to a blowpipe, alcohol lamp and a little cold sulphuric acid, can readily determine the presence or ahsence of tellurium in gold ore supposed to contain it. Break off a small piece of the ore, place it in a warmed porcelain dish, apply the hlowpipe until the ore is at an oxidizing heat, put two drops of the sulphuric acid on the porcelain dish and allow to mix with the ore—the reaction will immediately follow, if tellurinm he present, hy carmine and purple colors. The metal fuses at ahout 500° C., and is distilled at a very high temperature. Its vapor is golden yellow and has a very hrilliant absorption spectrum, while the electrical conductivity, like that of selenium, is largely influenced hy the temperature previous to heat, increasing after exposure to light, though not to the same extent as does selenium. Tellurium hurns, when heated in the air, with a hlue flame, enveloping white vapor of tellurium dioxide. It is insoluhle in water and carbon disulpbide, but dissolves in cold fuming sulphuric acid, imparting to the solution a most pleasing carmine color, which almost immediately passes into a purple. Tbe compact form is a silver white, resplendent

metal of a markedly crystalline structure. Its atomic weight is 125; sp. gr., 6.2. The precipitate of tellurium is at present worth about eighteen cents per gram.

THE incorporation laws of Colorado insist that the names of all incorporations doing business under the laws of that State shall begin with the word "The" and end with "company." These injunctions have always caused a lot of trouble at the office of the Secretary of State. Filers would go to a lot of trouble getting their companies into shape, decide upon a name and elect boards of officers under them, and then offer their papers for filing. In a very large percentage of cases the papers would be refused because either the "The" or the "company" or both would be lacking, the result of which would be a hasty meeting of the stockholders of the company and the name patched up to meet the requirements of Colorado laws. But now the *Republican* says there is a new trouble—names are running out. There is not a day passes that the department is not called up twenty times by organizers asking if such and such a name has been appropriated. That most generally asked for is the "Cripple Creek Gold Mining Company."

H. A. EVANS, writing from Rossland to the Spokane, Wash., *Spokesman-Review*, in regard to the claim-jumping which has been indulged in, says: "All kinds of claim-jumpers are to be found in Rossland. We have lawyer jumpers, surveyor jumpers, professional jumpers and others. The lawyer pays the professional to relocate claims; the bum jumper relocates and gives the lawyer a half interest to fight the matter in the courts. This causes the poor prospector to employ another lawyer, for which he gives half to defend the suit. This is the way matters have been going on in the district for some time. No sooner is a claim located than one of the class of jumpers will proceed to pull up the stakes and then swear the original locator had no stakes on the ground. The numbers are erased and the posts are used in the new location. This is the way the poor prospector is robbed of his hard-earned claims. It is simply impossible for a poor man to hold a claim within three or four miles of Rossland if there is any ore in sight unless he lives on the ground and carries a rifle."

Mineral Land Commissioners' Report.

The Mineral Land Commissioners for the Helena district made their report to the department this week. There were examined and classified by the commissioners during the year 349,070 acres. Of this 67,610 acres were classed as mineral and 281,460 acres as non-mineral. The total cost of the work to the Government was $8131.55. The salaries of the commissioners formed the chief item of expense, aggregating $5990. The cost of the examination and classification per acre was two and three-tenths cents.

In the report an estimate is made by the commission on the time it will take to complete the work of classification as now contemplated by the law. There are in the Northern Pacific land grant in the Helena district—exclusive of the first and second indemnity lands—3,409,960 acres. Of this there are 1,353,780 acres of surveyed lands, 2,056,180 acres unsurveyed. There remain of the surveyed lands yet to be examined 1,004,710 acres. The unsurveyed lands, the commission believes, can be classed next year. Regarding the unsurveyed lands the commission says in its report:

"From the above estimate, based upon the experience of the past year, and believed to be substantially correct, it appears that the work in the district can be accomplished in the time limited therefor, that is, 'within the term of four years from the date of this act,' provided, however, that reasonable facilities and proper and necessary clerical assistance, and the aid of a small surveying corps to be attached to and placed under the direction of this board, be furnished to aid in the prosecution of such work."

The commission asks to be provided with a clerk, that it may devote all its time to the work of classification, instead of spending a part of it to clerical work, as during the present year. A civil engineer is also asked, with the necessary assistants, to establish and raise monuments at the boundaries of the unsurveyed tract of lands examined and classified by the board.—Western Mining World.

"Will Clean It All Up During 1896."

The following part of an editorial in the Marysville *Democrat* is interesting, coming from a source that, though not friendly, tries to be fair:

During the present year there has been a continued warfare, on paper, between the Miners' Association and the Southern Pacific Company relative to what the former designate mineral lands. The lands in controversy are principally in the grants to the Central Pacific Company, and the California and Oregon. Early in the season men were sent to Washington in the interest of the Miners' Association, to use their influence to defeat the patenting of the lands to these companies. It was then that the *Record-Union* jumped onto hydraulic mining with both feet. It denounced the Caminetti law, the U. S. Debris Commission and miners in general. The Commissioner of the General Land Office and the Secretary of the Interior paid no attention to the ruction, but continued in the even tenor of their duty. Since the commencement of the present year more than 600,000 acres of land in these grants have been patented to these companies. Last week 233,946 acres were approved for patent, and if the officers continue as in the present year they will clean it all up during 1896.

The Pneumatic Torpedo Plant at Fort Winfield Scott.

Written for the MINING AND SCIENTIFIC PRESS by EDWARD A. RIX, P. E.

About one year ago the Pneumatic Torpedo and Construction Co., of New York, accepted bids for the construction of the power plant for the pneumatic dynamite gun plant at Fort Winfield Scott, in San Francisco.

The Eastern manufacturers had the advantage of the Sandy Hook plant, the Shoeburyness plant established in England and the two plants established on the El Cid and the Nichteroy, which were furnished to the Brazilian government. Yet the company decided in favor, after competitive bids, of the plans furnished by the Fulton Engineering and Shipbuilding Works, of this city, which were designed by Mr. Edward A. Rix, of this city.

This plant has just been tested, during the last week, by the Government board, and the results have shown that the quality of the machinery and the character of the tests in every way exceeded those made at Sandy Hook during the last installment made by this same company.

The Rix air compressors are two in number and of the duplex pattern, each of about 400 H. P. capacity. The air is compressed in the first cylinders to 75 lbs. to the sq. in., and is thence taken into a cooling tank containing about 1000 running feet of one-inch copper pipes, in which the air is cooled from the temperature of its discharge from initial cylinders, which is about 320 degrees, to the temperature of the water or thereabouts. It is delivered to the intermediate cylinder at about 65 degrees in temperature, and is there compressed in a single-acting ram to about 400 lbs. pressure. The air is thence taken again into the intercooling chamber, through about 400 feet of copper pipe and is cooled again to the temperature of the water and is delivered to the high-pressure cylinder at the same temperature as to the intermediate cylinder.

In the third cylinder it is compressed to 2000 lbs., the air being delivered at a temperature of about 358 degrees. This is conducted to the third intercooler, where the temperature is reduced to about 65 degrees, and is thence conducted to the storage reservoir.

The engines which drive this compressing plant are of the Meyers cut-off style, and are extremely well balanced and well constructed; in fact, the cards and the results show that these compressors have a mechanical efficiency of about 85%, and throughout the system there is a saving of 36% over the work required to compress the air to 2000 lbs. adiabatically.

The amount of air delivered per hour, at 2000 lbs., is about 460 cu. ft., which is more than ample to keep the machines in operation, in fact, during the test one machine would have been sufficient to have maintained the number of shots.

One feature about this whole compressing plant is the facility with which the air is cooled. Each cylinder has a number of independent circulations, notably the high-pressure cylinders, where four circulations are introduced, each independent of the other, viz., a circulation for the head and valves, two circulations for the cylinders and a circulation of water within the ram itself while it is in operation. This preserves the packing of the ram and at the same time contributes largely to the cooling of the air during compression.

During the operation of the plant, the initial temperatures, that is the temperatures of the inlet for each air cylinder, did not exceed 70 degrees, while the temperature for the discharge of the air varied from 290 to 350 degrees.

The mechanical efficiency of the plant, that is the ratio of the indicated horse power in the the steam cylinders to the I. H. P. of the air cylinders, was 85½%, which is quite high, considering the fact that the machines were not designed for extra economical use, the idea being to provide for the Government something that could be operated easily and which was not easy to get out of repair.

After passing the intercoolers the air is delivered into 24 storage tanks, each 16 inches in diam. by 24 ft. long, containing about 650 cu. ft.

These tanks are connected with the firing manifolds. These manifolds are of complex construction, designed so as to admit the air to any or all of the guns and to admit the air to any or all of the storage tanks.

The air in the storage tanks is maintained at 2000 lbs., while the air delivered to the storage tanks of the guns is at 1000 lbs. pressure.

The guns themselves are very interesting in their character. They weigh about 70 tons each, above their foundations, are 50 feet long by 15 inches in bore. They can fire projectiles of any caliber from 8 to 15 inches, the difference in caliber between the full and the sub-caliber being made up by wood pistons in four sections which surround the projectile and which fly off immediately upon leaving the gun. These projectiles vary from 11 feet long to 15 inches in diam. of the full caliber, to 8 inches in diam. and 8 feet long in the sub-caliber. The latter carry about 100 lbs. of dynamite explosive and the former carry 500.

The guns are easily traversed around the whole 360 degrees of circle, by an electric motor placed within one of the supports of the gun, and the connections of this motor are so arranged that it will also operate the mechanism for elevating and lowering the muzzle. The gun is ranged from 0 to 35 degrees, which is considered ample for all ordinary purposes. The greatest range obtained with the 8-inch projectile, carrying 100 lbs. of dynamite and which flies under a loss of pressure of about 100 lbs., was 5000 yards and slightly over. This may be considered the maximum flight for usual purposes. The 10-inch is proportionately less, and the 15-inch projectile, which carries 1000 lbs. of dynamite and weighs 1100 lbs., has a range of from 2000 to 2500 yards. All of these projectiles may be thrown accurately, in fact there is no reason why, with the same pressure, the same amount of air wasted in the throwing of the projectiles, the same weight of projectile and the same character of projectile, the atmospheric conditions being the same, it should not land practically in the same place. The results at Fort Point demonstrated this. The 8-inch projectiles were thrown from 5000 to 5070 yards, and were placed in the target, 70 yards in length by 30 yards in width, which far exceeded the Government requirements.

The material used in these projectiles is nitro-gelatine, composed principally of nitro-glycerine and gun cotton. The whole projectile is of an intricate mechanism and has provisions made for exploding the charge either by direct impact, side impact, or by a delay of from one to three seconds. These projectiles are expensive, probably costing $1000 each, and their capacity for destruction is fully proportional to their expense.

In the test at Fort Point, the 15-inch projectile at 2000 yards threw up a column of water 350 to 400 feet high and 100 feet in diameter at the base, showing conclusively that it would be amply capable to destroy, within a range of 100 feet, the largest man-of-war.

The boilers which actuate this plant were manufactured by the Chandler & Taylor Co., of Indianapolis, are of about 500 H. P. capacity and are operated under forced draught, the idea being to keep the stacks low enough to be invisible from the bay. All of the fans which furnish the forced draught are each capable of furnishing 13,000 cu. ft. of free air per minute to the grates. The boilers are fed by Deane duplex steam pumps, which are reinforced by sets of injectors.

The dyuamo is operated by an Armington & Simms engine, of about 50 H. P. The dynamo is capable of furnishing 300 amperes, at 125 volts. The dyuamo was manufactured by the Electrical Engineering Co., of this city, and is first-class in every respect. It also furnishes about 50 lights for the engine room and offices during the evening.

The compressors and guns, in all the requirements exacted by the Government, have probably exceeded these requirements by a combined percentage of more than 1000%. There was not one hitch or delay during the tests, excepting those caused by the weather, and judging from expressions, the entire Department feel that they have in these guns and the machinery to operate them a most efficient and satisfactory plant.

"Hope Springs Eternal in the Human Breast."

Under date of the 16th inst. a Solano county, Cal., subscriber writes as follows:

Upon the wrapper I see that my subscription expired 10th inst.

Thy servant hath nor scrip nor coin,
Nor knoweth he the coming morn
When friendship's ties and coin galore
Shall add tres pesos to thy store.

O promise! thou, most devious thing,
A wild bird loose on speedy wing,
A sugar-coated, bitter pill—
Sometimes may cure, ofttimes may kill.

When the wheel of fortune turns again
You'll hear from the cabin of William of Wayne.

GOLD is being produced in the Cripple Creek district to an encouraging extent, and on the strength of this a large number of "mining companies" is being organized there. The situation leads the Cripple Creek *Mail* to sound a note of due warning. Speaking of these meretricious organizations, it says: "It is safe to say that the great majority of them will never attempt to operate here. Their mission from the start is to fleece outsiders by means of worthless stock, and it behooves the uninitiated to be a little wary about investing in stocks of unknown value. Many of these companies do not own anything except a stock book. Others that are nearly as bad are companies of doubtful ownership, having nothing but unpatented claims. And there is still another class to be avoided—the companies composed and officered by obscure, irresponsible, incompetent and disreputable men. Many of these men have not a dollar and wouldn't know a mine if they saw it. We say to investors: Go slow about buying mining stocks until the same is proven of value."

Scientific Progress.

Heat Insulating Material.

Experiments give the following as the conductiug power per square foot of four materials, difference of temperature 1° Fahrenheit:

Copper	515 heat units per hour.
Iron	233 heat units per hour.
Ordinary stone	13.68 heat units per hour.
Powdered chalk	.869—or less than one heat unit.

Hence, copper conducts 593 times as much heat as the chalk, iron 268 times as much, aud ordinary stone 15 times as much. Chalk is used in the illustration because it is very similar to the three materials that are being most largely used in combination with ashestos in making high temperature coverings—infusorial earth, carbonate of magnesia and gypsum each being dependent for its strength largely upon the ashestos incorporated with it.

Porousness is one of the necessary qualities of good non-conductors, and this porousness uecessarily tends to weakness, heuce clothing for steam pipes wears out. Means for counteracting this natural weakness and for making coverings permanent are needed. There is only one practicable way to render coverings really permanent—to strengthen them by reinforcing with iron. Iron can be so incorporated in the hody of the covering that the atmosphere cannot reach it; the life of iron thus protected from the atmosphere is almost unlimited, and thus situated it will hold the covering in place indefinitely, making it really permanent.

A high degree of permanency is attained by using one inch thick of any of the well known mineral coverings, aud outside of this from a half inch to an inch of wool felt paper, made into solid tuhes and securely fastened over the mineral coverings.

Felt paper pipe coverings, while excellent non-conductors, have heretofore failed of permanency because they were placed so near the hot pipes that they were gradually hurned up. With au inch of good mineral insulation next to the pipe this charring weakness of the felt paper is entirely overcome, and the paper tuhes heing very strong will, if properly fastened, hold the magnesia, asbestos, or other mineral covering in place two or three times as long as it would otherwise remain.

Less than an inch of mineral under the paper will not protect it, hence this plan means substantially two coveriugs and adds materially to the cost. It is not possible to make heat insulating coverings permanent without making the first cost more than it has heretofore heen, but hy increasing the cost they can be made permanent.

Ashestos is the ouly mineral known that furnishes fihers long enough and stroug enough to he woven into strong threads. It is to a high degree fire and acid proof. These properties adapt it to many useful purposes and it is the only material yet discovered that will do for some of these purposes.

Broadly speaking, asbestos is a silicate of magnesia, but in some cases lime displaces the magnesia hase; in rare cases alumina takes the place of the magnesia, and what is called hlue ashestos is a silicate of iron, irou in this case displacing the magnesia. This hlue asbestos or fihrous silicate of iron possesses mauy times the strength of true asbestos, a thread of it one-twenty-fifth of an inch in diameter carrying one hundred pounds, but hy reason of its contaiuing from 30 to 40 per cent of protoxide of iron it is neither fire nor acid proof; nor is it a good uon-conductor of heat, hence does not possess the valuahle properties of true asbestos. Silica and water are the only two elements that are always constant in ashestos, the silica rarely falling below forty parts to the huudred, while in some of the anhydrous varieties the water falls as low as two or three parts to the huudred.

There is a duty of twenty-five per cent on all except crude and ground ashestos and paper stock, and if the tariff laws were enforced the people of the United States could he supplied in the main from Wyoming, and thus give ashestos the benefit of the policy of our Government in protecting American industries; hut at present all kinds of manufactured ashestos fiher are heing imported from Canada, free of duty, under the classification of ground asbestos and paper stock. The provision for admitting ground ashestos and paper stock free was only intended to apply to these, heuce the present ahuse of our tariff laws, hy which fiberized ashestos is admitted free, defrauds the Government and discourages the production of asbestos in the United States.

Fire Under Water.

The hurning of phosphorus iu water is a safe and simple experiment. A few grains of phosphorus, say four or five, ahout half the size of a coffee hean are thrown into a tall glass filled with water. Then throw in from a quarter to half an ounce of chlorate of potash. Introduce a long-stemmed glass funnel and add slowly about half an ounce to an ounce of sulphuric acid. For greater safety place it in an empty fireplace, as fumes are driven off in the chemical reaction which takes place, which are disagreeable if not actually poisonous. They are so slight, however, that in an ordinary sized room this precaution is not an absolute necessity, although it is desirahle. In a short time brilliant sparks will be emitted in the water, and fire will hlaze, increasing to a not alarming hut still hrilliant degree. A slight crackling noise will he heard.

The action will continue for nearly half an hour in a somewhat decreasing degree, but still exceedingly beautiful. While the experiment is extremely simple in itself and costs but a few cents, the chemical reactions which take place are rather intricate. Following are the various reactions which occur in producing this beautiful effect:

$K C L O_2$ = Peroxide of chlorine.
$K C L O_3$ = Chloric acid.
$K C L O_4$ = Perchloric acid.

The action of sulphuric acid on chlorate of potash, $K C L O_3$, is to decompose a portion of the chloric acid into $C L O_2$, a very explosive yellow gas, which breaks up into C L and O at a gentle heat, which in our experiment it gets hy the mixture of sulphuric acid with the water. It inflames the phosphorus at the moment of explosion (the crackles we hear), and supplies it with bubbles of oxygen to hurn it. The whole action is:

$$3 K C L O_2 \; 2 K H_2 S G_4 = 2 K H S O_4 \; 2 C L O_2 \; A_2 O.$$

$K H S O_4$ is an acid sulphate of potassium in which an atom of H is replaced hy K.

Proposed Substitute for the Turbine.

A scheme for utilizing the power of a waterfall is attracting some attention in Canada, where, it is said, an attempt is ahout to be made to develop 175 horse power by this method. The essential principle involved is the compression of air by the force of the falling water, and the employment of the compressed air for driving a motor, either close at hand or at some distance. From a tank or standpipe, in which the water stands at the same level as ahove the dam, the fluid is permitted to pour down a pipe, around whose base are a lot of holes, admitting air from tuhes running up to the surface of the water. The air is sucked in and compressed by the heavier fluid, and the two are automatically separated hy gravitation.

The air finally passes into a storage chamber. The incredihle statement is made that from 70 to 80 per cent of the latent power stored in falling water can he rendered available in this manner. This is no more than a turhine yields; hut a water-wheel cannot transmit its energy to a distance without intermediate agencies like dynamos (which entail a slight loss), whereas compressed air can he used to run machinery fifteen or twenty miles away. According to the Buffalo *Express*, a stock company has been formed to introduce the Taylor system, and a Canadian college professor of engineering is named among those who have given it approval. It is asserted that a power plant of this class is about to he installed at the Dominion Cotton Mills, in Magog, near Montreal.

Mechanical Progress.

A Wonderful Light.

In the lamphouse of the government lighthouse station at Tompkinsville, Staten Island, is housed the most wonderful light in the world. The light itself stands fifteen feet high, the face of its bull's-eye is nine feet across and its lenses are as much as four inches thick. It is capable of flashing a ray of light equivalent to the power of 250,000,000 candles, and the distance from which it can be seen on clear nights is practically limited only to the curvature of the earth.

That part of the light which revolves weighs fifteen tons and so exquisite is the mechanism by which it is moved that the pressure of fingers will turn it. A child could control the machinery, and the motive power which propels it is a single hit of clockwork incased in a hox two feet square.

The light consists of two concave discs about eight and one-half feet in diameter. These discs are placed back to back about a foot apart, and in position look like tremendous double convex magnifying lenses, so large that they could not be cast in two single pieces, and had to be built up in segments, and the whole strung together on a great iron skeleton. And this, in point of fact, is precisely the case.

Back to hack, the lenses inclose a hollow interior, into which is thrust a powerful electric light. This light of itself is about 7000 candle power. When its light is projected through these huge magnifying prisms, its power is iutensified more than 35,000 times.

It is altogether beyond the human imagination to grasp the possible effect of 250,000,000 candles, which is the illuminating power of this new lighthouse wonder. At the present time the finest oil lamp which ingenuity has been able to devise may he seen on a clear night some 35 or 40 miles at sea. The new light may he seen at a point 120 miles away.

Accuracy of Workmanship.

Advance of accuracy of workmanship in machinery is one of the remarkable features of manufactures. Formerly, if a shaft could be made right within one thirty-second of an inch, all was well. Iudeed, under old processes, this was as fine a degree of correctness as the eye could perceive. But this was altogether too far from perfect to answer many purposes, and mechanics set about devising some means to insure more absolute accuracy. One of the first suggestions that the eye was less reliable than the fingers came from the fitting of certain cylinders with plugs. It was fouud that a uumher of plugs could be made, all precisely alike so far as the eye could judge, hut the veriest novice detected a difference in their size the moment they were applied to the hole for which they were intended. It is said that now the difference of one five-thousandth of an inch can readily be perceived by the most experienced person.

Table of Specific Heat.

Water	1.000
Vinegar	.920
Strong Brine	.700
Alcohol	.659
Ice	.504
Oil	.310
Air	.238

By "specific heat" is meant the capacity of a suhstance for absorbing heat, and is the amount uecessary to raise or lower a substance one degree. The table indicates the ratio of quantity required to raise or lower an equal weight of water one degree. Example: One pound of water raised or lowered one degree Fahrenheit is called one thermal unit, and at 32 degrees its specific heat is one. The amount of negative heat uecessary to cool 100 pounds of water 10 degrees would be 100 pounds multiplied by one thermal unit, multiplied hy 10 degrees, which equals 1000 units. To cool 100 pounds of alcohol 10 degrees Fahr., as per ahove table, would require $100 \times .659 \times 10 = 659$ negative heat units. Hence it appears that only about three-fifths as many negative heat units are required to cool alcohol as are required to cool an equal quantity of water.

The New Maxim Gun.

Mr. Maxim's special pet, his "daily," is the marvelous gun that does not fire single shots, hut literally "rains bullets." It is a light affair, having the appearance of a small brass cannon, mounted on a tripod and aimed and worked by one man, who sits behind it, on a saddle like that of a bicycle, from which he can poiut it up and down with as much ease as if it were a pistol, or swing it to the right or left, as an enemy approaches from one or another quarter.

The gun loads itself. It utilizes the recoil, so that (as the cartridges are strung on a belt, that carries from 150 to 400 rounds) every kick of the gun throws out the exploded cartridge on one side of the gun, and on the other throws the next cartridge into place, so that the discharge is incessant. One has only to press the hutton and the gun does the rest. As long as one keeps his finger on the button, the firing goes on, the gun throwing eleven minie bullets a second—666 a minute!

That steel harrel, through which an incessant flash streams like a continuous streak of lightning, melting or exploding everything near it, is incased in a water jacket, so that the gun, like a good soldier, keeps cool while doing its most deadly work.

The man at the gun is master of the situation, and ueed not run away even if he is attacked hy a regiment unless it comes upon him hy surprise and takes him at close quarters, or some villainous sharpshooter picks him off before he gets to business. Let the regiment keep at a respectful distance and give the hrave fellow a chance, and he will lay them low hy hundreds; and indeed, let the enemy be ever so numerous, if they will only stand up like men to be shot at, he will mow dowu half a dozen regiments while he is smoking his cigar!

A New and Practical Invention.

A device has heen introduced to take the place of the wooden plugs generally used when it is desired to screw into hrick or plaster walls. It is a spiral of iron wire doubled hack upon itself, the inner turns being of such a diameter as to form a kind of screw thread, while the outer turns serve to hold the wire plug in the wall. To fix these plugs a hole is drilled in the wall a quarter of an inch greater in diameter than the outside dimensions of the plugs and a little deeper than its length. The hole is then thoroughly wetted by injecting water and afterward filled with plaster of Paris. The outer windings of the wire socket are also filled with plaster, and the socket or plug with its screw is inserted in the hole to the required depth. After the plaster has set the screw may he removed, and it should he greased before it is put hack. This device will be of use to electrical fitters for fixing switchhoards, switches, pushers and other electrical fittings, as well as to decorators and plumhers, especially when fitting has to be done in houses already occupied, where the saving of litter is an object. In new houses the wall plugs are placed in the plaster at different points where there is a likelihood of supplementary fittings being subsequently required.

Electrical Progress.

Track-Laying Machines.

In the laying down of street railways great inconvenience is caused to the public by the obstruction due to the piling of rails, ties and track material at the sides of the road ready for use when wanted, and by the carrying of these materials across the road during track laying, especially on busy streets. Excellent work has been done by an improved track-laying machine in showing how this source of trouble can be avoided. A horse-car line on the Wentworth-avenue line of the Chicago City Railway was being equipped for electric traction. The rails weighed eighty-three pounds per yard. In conducting the work by means of the track-laying machine the rail chairs were first placed, and then the rails were lifted and lowered into place. Two men only were required for the work, one man for operating the engine and one to attach the tongs to the rail and to swing and guide it into position. The total cost of operation per ten-hour day was $5, or a saving, according to the contractor, of $15 per day over the ordinary method of lifting and placing the rails by haud. About 2200 feet of track would be laid complete in a ten-hour day. An improved form of the ordinary track-laying machine, which has a series of tramways about thirty feet long and twenty inches wide, fitted with heavy rollers, the tramways attached to the sides of flat cars and supported by plank projections, are of much lighter construction. The cars are of the skeleton flat type, about thirty feet long, six and one-half feet wide, and thirty inches high, and weighing about 2200 pounds each, with tramway attached. Four men can put all the parts together of the four cars sent with each machine, in one day. When the cars are loaded they can be sent to the front by steam, electric or horse power, and one team will give all the power needed. This plan of track laying saves great expense. A practical builder of electric railways has estimated the cost of hauliug and distributing rails and ties with teams for a road ten miles long at an average of $170 per mile, and says that considerable loss of money and time is sustained by damage suits caused by horses taking fright at the piles of material scattered along streets and roadways. The track-laying machine reduces one of these expenses to a minimum, and absolutely banishes the other. Besides this, it reduces the pilfering of material and tools, makes danger lights unnecessary, and saves damages to rails in unloading.

Edison and His Inventions.

Being recently asked as to how much money he has made out of his inventions T. A. Edison said: "Considered purely as inventions, they have cost me more than I have ever received from them. Nine of my inventions have proved very profitable. These are the district telegraph system, the quadruplex system of telegraphy, the stock ticker, the telephone, the electric pen and mimeograph, the incandescent lighting system, the electric railroad, the phonograph and the kinetograph. I claim one-half of the credit for the invention of the first, third and fourth of these and the others are entirely my work. I received very little for the district telegraph. I sold the quadruplex system of telegraphy for $30,000 and spent all of this sum and more trying to devise a plan to make a wire carry six messages instead of four. I failed, and so in the end was worse off then when I began. The stock ticker brought me at different times about $50,000, but it cost me more than that to perfect it. From the telephone I realized a clear profit of perhaps $25,000. Bell made less than half a million, though his farther-in-law rolled up a vast fortune by securing control of large blocks of stock when it was selling for little or nothing. The profits of my electric pen and mimeograph have been very small. The incandescent light has netted me $140,000; it cost me nearly three times that sum to perfect it. I did not get my money back from the electric railway, which I sold out long ago, and I made nothing from the phonograph, which I have also sold. The kinetograph has not as yet returned me the original outlay."

An Electric Rifle.

Heavy guns have long been fired by electricity, but electrically exploded small arms have not hitherto come within the sphere of the inventor. It is hard to see wherein an electrically actuated rifle can for all practical purposes be an improvement on the extremely efficient exploding mechauism with which arms of precision are now fitted, but the designer of a rifle in which the cartridge is exploded by electricity claims that in this method there is none of the flashing out of the powder common with the merely percussion hammer, and all the powder is consumed, to the manifest improvement of the penetrative power of the bullet. A battery is inserted in the stock, with wires running to a strip of metal on the one hand and the hammer, which is fitted on the upper part of the trigger, on the other. The metal strip makes contact with the metal base of the shell. A pin, which runs into the cartridge, has its rounded head projecting slightly beyond the base of the cartridge. Between this and the point of the hammer is a plate studded with a pointed head, which lies close to the cartridge. As the trigger is pulled the hammer flies forward, striking the plate, whose pointed head is driven onto the projecting head of the cartridge pin. The spark thus caused within the cartridge explodes the powder.

SOME IDEA of the diversity of uses to which electric motors are now being put, and the rapid spread of electricity in different directions, may be gathered by glancing at the list of orders for motors received in the Power and Mining Department of the General Electric Company during one month this summer: Operating mining machinery, shoe factory, operating a yarn factory, a tannery, a powder mill, a watch factory, iron working machinery, a foundry, hoists for electric cranes, ventilator on a gun boat, propelling electric launches, the operation of elevators, blowing church organs, operating woolen mills. These orders are scattered throughout the following States: California, Colorado, Indiana, Ohio, Connecticut, Michigan, Pennsylvania, Rhode Island, Wisconsin and New York; Lima in Peru and Rio de Janeiro in Brazil.

NORTH ADAMS, MASS., continues to be puzzled over a queer condition of electricity in the Hoosac tunnel. Although when the great four-and-one-half-mile cut was built no ores, magnetic or otherwise, were encountered, there was a general expectation that rich ore pockets would be found; yet, for an unexplained reason, no electrician has been discovered who can send a telegraphic message on a wire running through from portal to portal of that tunnel, even though such wire ran inside an ocean cable. Messages have to be sent on wires strung on poles over the top of the mountains, fully nine miles, and that is the way the in-going and out-going passenger and freight trains are heralded to the keepers of the two tunnel approaches.

THE Niagara Falls Power Company will extend its wheel pit to accommodate three more turbines to work in conjunction with three new dynamos capable of producing 5000-horse power each. It is interesting to note that among the uses to which the Niagara Falls electric power is first put are three comparatively new industries—the manufacture of aluminum, of carborundum and of calcic carbide—this last-named for making acetylene gas.

Practical Information.

Not So Very Unusual.

Two full moons this month, one on the 2nd, the other on the 31st, have occasioned in several newspapers the statement that not since the birth of Christ have there been two full moons in a calendar month. Reference to old almanacs would at once show the mistake. It is no uncommon phenomenon to note two full moons in one month. The error probably arises from the fact that ordinarily but one full moon is noted in a month, and not once in a thousand years does it occur that no full moon happens to lie within the limits of even the twenty-eight days that three-fourths of the time constitute the month of February. The ordinary term "a month" has no exact standiug among astronomers. There is no astronomical reason why one particular month should have thirty-one days and auother thirty or twenty-nine or twenty-eight. Astronomers have solar months, nodical months, anomalistic months, sidereal months, synodic months, etc. When the ancients commenced to reckon time they used the day and the year. Then they saw the moon and invented the month. Afterward they noted the stars, and observed that a belt around the heavens was marked by twelve constellations, which they called the signs of the zodiac. These divisions proved too inaccurate for modern astronomers, and as a result there are now many kinds of months. The calendar month is the one most generally noted. The solar month is an exact twelfth part of a year, and is reckoned by the signs of the zodiac. It amounts to thirty days and something over ten hours. Then there is the nodical month, which is the time of the moon's revolution from one of its nodes to the same node again, and is equal to 27.21222 days. The anomalistic month is the time of revolution from perigee to perigee again, and equals 27.5546 days. The sidereal month is the time occupied by the moon in passing from one star to the same star again, and is equal to 27.32166 days. The synodic month is simpler, this being the interval from new moon to new moon again. It varies somewhat on account of the eccentricity of the moon's orbit, and of that of the earth around the sun, but its mean value is 29.53059 days, or 29 days 12 hours 44 minutes and 2.684 seconds, with the possible variation of a hundredth part of a second. The reason why this synodical month is longer than the sidereal is that during each sidereal month of 27⅓ days the sun has advanced among the stars and must be caught up with. These figures appear to be sufficiently accurate for all ordinary purposes, but the astronomers are not yet satisfied. They have discovered that the month is a trifle shorter now than in the days of Ptolemy, and this trifle must be computed down to the fraction of a second. But that is another question. Enough figures have been given to show how it is possible for two full moons, which mark the beginning of two lunar months, to happen in a single calendar month. Owing to the difference in the length of the different kinds of months the phenemenon must happen in some month about once in three years. Long before Christ, Meton, a Greek, in an effort to reconcile lunar and solar time, discovered the Metonic circle, which consists of 235 lunar months, and is equal within two hours to nineteen common years of 365¼ days. Every nineteen years the new and full moons recur on the same day of the year, and about the same hour of the day. The calendar of the phases of the moon, therefore, is the same for 1895 that it was for 1876, and that it will be for 1914, except that the leap years may in some cases make a difference of a day. The statement that this is the first December wherein two full moons have occurred is also a mistake. In 1876 there were two full moons in the last month of the year—one on the first day of the month, the other on the 29th.

What Labor Can Make Out of $10 Worth of Pig Iron.

At the recent meeting of the South Staffordshire Institute of Iron and Steel Works' Managers, Thomas Morris presented some interesting facts about the remarkable achievements that have been reached in the manufacture of fine wire. Of the antiquity of wire, Mr. Morris said, there could not be the slightest doubt. That used in the dress of Aaron, the high priest, was stated to have been cut from thin plates of gold, and wire has been discovered that was made as far back as 1700 B. C. It was not, however, until about the middle of the 14th century that wire drawing was first practiced, and then in Germany. Wire drawing was practiced in France at the end of the 15th century, and it was nearly a hundred years later before the industry was introduced into England, during the reign of Elizabeth.

The Forest of Dean was long the seat of the wire drawing trade. In 1663 the first mechanical wire mill proper was erected at Sheen, near Richmond. Birmingham appeared to have taken up the manufacture of wire in the 18th century with characteristic energy, but early in the present century Lancashire began to take the lead, both as regards quantity and quality.

Mr. Morris gave an interesting description of the various articles that illustrated his paper, especially the various wires, and pointed out that the Warrington wire manufacturer who presented him with many of the specimens got $4.32 per pound, or over $8600 per ton, for the specimen of drawn wire, which was largely used in the construction of piano and other musical and mechanical instruments. For the pinion wire he got $21.60 per pound, or $43,200 per ton. It took 754 hair springs to weigh an ounce of 437½ grains. It took 27,000,000 of them to weigh a ton, and, taking one to be worth a cent and a half, the value of a ton of these apparently cheap little things ran up to over $400,000. The barbed instrument used by dentists for extracting nerves from teeth was even more expensive, representing a rate af 2,150,000 per ton. A mile length of No. 19 size wire only weighed 21 pounds, and many of the ingots were 12 to 14 cwt. each and after allowing for all waste they could get 50 miles of wire from one ingot.

Moving a Machine Shop Without Stopping Work.

Recently in the work of track elevation upon the Providence division of the New York, New Haven, and Hartford Railroad, it became necessary to move one of the largest factory buildings of the Sturtevant Blower Works at Jamaica Plains. This building is 50 feet by 350 feet, about half the length of which has three and the other half two stories. The three-story portion was moved about 50 feet east and 300 feet south, and the other part was moved 50 feet east from its former location. The work in the three-story section, except upon the lower floor, was carried on all the time during the removal, power being supplied by a 20 H. P. electric motor, belted from the second floor of the building to the main line of shafting. Provision was made for removing the motor away from the generator, which was situated in the engine-room, by placing a reel containing the conducting wire upon the floor of the moving building, which allowed the wire to unwind and made it possible to keep the motor running while the building was upon the rollers. The moving was carried out in the usual way by means of capstans worked by horse power which were connected to the building by ropes and blocks. The building was thoroughly tied in both directions by heavy iron rods before the moving was commenced, and, though the walls of the first story are 20 inches thick and 16 inches at the second story, the work was done without injury to the structure, in spite of the fact that the latter part of the journey was over filled ground.

Mining Summary.

CALIFORNIA.

Alpine.

NOT ACCURATE.—"The Mountain Valley Tunnel mine of Markleeville, Cal., is sold to a San Francisco syndicate headed by C. C. Herman, the hatter; consideration, $225,000, $10,000 having been paid down." The above is from a Carson, Nev., paper. There is no Mountain Valley Tunnel mine at Markleeville, but there is a Mountain tunnel at Silver mountain. If the owners of the tunnel have made such a sale, they are in luck.

Amador.

THE ONEIDA MINE.—The *Record* is informed that at the Oneida a new shaft will be sunk to the depth of 1600 feet before crosscutting and other underground development work will begin. The old incline which was down some 1200 feet when work was stopped in 1880 will probably be cleaned out and retimbered at a later date.

Butte.

IN FORBESTOWN.—The Gold Bank mill and mine is running the tunnel and is in over 1100 feet. There is 200 feet to go before the main lead is struck at the 1000-foot level.

Calaveras.

DONALLON MINE.—H. E. Hackett, owner of the Donallon mine, expects to have his new stamp mill in operation by Feb. 1, '96.

STRIKE IN THE PURE QUILL.—From the Pure Quill mine at Angels is reported a rich strike, a five-foot shoot of ore being found which shows free gold in ribbon streaks.

BONDED.—*Chronicle:* The Maloney Ranch, near Mokelumne Hill, has been bonded to W. D. Chambers for $10,000. There are a number of quartz ledges on this property and the work of developing some of them will be commenced at once.

THE ROANOKE MINE.—At the Roanoke mine a new hoist has been put up on the Lamphear shaft and a six-inch Cornish pump put in, water for running the hoist and pump being obtained from the Mokelumne canal under 140 feet pressure. The work of cleaning out the Lamphear shaft is going steadily ahead, a depth of 145 feet having now been reached, which is about thirty-five feet from the bottom. When the shaft is cleaned and retimbered the work of sinking will be commenced, and it is calculated that with the present hoist a depth of 1000 feet can be reached if found necessary. There is a tramway 1500 feet in length leading from the Lamphear works to the mill on the Moser mine, over which it is intended to run the ore when the work of sinking is commenced. It is the intention of the company to put up an electric plant and run the ore cars over the tramway with a trolley wire. At the Moser it is 450 feet from the mouth of the tunnel to where it intersects the ledge which is 160 feet from the surface. At the end of the tunnel an excavation has been made sixteen feet wide, thirty feet high, and fifty feet in depth in which the hoist was placed. A shaft was raised 160 feet to the surface through which water is conveyed in an eleven-inch pipe to run the hoist. Work is now going steadily on in the three compartment shaft which at present has reached a depth of eighty feet below the intersection of the tunnel with the ledge. The lead in the bottom of the shaft shows exceedingly well, the ore averaging $10 per ton, while the ledge is six feet wide. There is an eight-stamp mill on the property which is run by water power under a 225-foot pressure. No concentrators are at present used in the mill, although it is intended to put in two in a very short time as the ore is now carrying extremely rich sulphurets. An addition of twelve stamps is to be made to the old mill, making twenty in all, the work of excavating for the new millsite having been commenced. Mr. W. T. Harris is superintending operations for the company. There are at present twenty-six men employed at the mine under the foremanship of W. H. Curnow.

El Dorado.

AROUND PLACERVILLE.—(Special correspondence)—C. E. Suman is reopening for W. P. Stanley and others the old Independence and Louisiana mines, twenty miles south, in the Brownsville district.

S. F. Woodworth has bonded the Harrison mine, six miles north, adjoining his own property, on which he is erecting a ten-stamp mill.

Sam Adams gave an option on property on Nigger Hill, six miles south, upon which is being erected a two-stamp mill for prospecting purposes.

Wm. O'Connor is working his seam diggings on Poverty Scratch, fifteen miles south, and taking out $2.50 to the pan.

W. P. Stanley is sinking a new shaft and removing the hoisting works at the old Toll House mine, about three miles south, with a view to reopening both mine and mill.

The Big Sandy, five miles north, owned by Toledo people and which has been idle for three years, is to be again put in active operation. Contracts have been let for sinking a new shaft and the placing of machinery. It is due Mr. F. W. Beardslee of the Lady Emma to say that, after careful examination of the property, he advised the owners to reopen the plant.

C. J. Heald of Nashville is developing the Lone Star, twelve miles south. At a depth of 100 feet the lead is six feet wide, and the ore runs $10 per ton.

Nevada.

THE COE MINE.—J. P. Meleville has bonded the Coe mine for a French and Belgic Company.

THE CADMUS MINE.—*Transcript:* The vertical shaft at the Cadmus mine is now down 100 feet. At a depth of ninety-five feet a vein two feet wide was cut.

Placer.

THE HERMAN.—At the Herman the mill is running night and day, working twenty-five or thirty men. A two weeks' cleanup recently realized $5200.

PENNSYLVANIA MINE.—*Telegraph:* The last cleanup of the Pennsylvania mine, the other day, of forty tons of ore, yielded $26 per ton. During the past two years the mine has turned out about $49,000 in gold, and that, too, with only five stamps, which run only part of the time. The ledge is now turning and the company are going to sink deeper and also contemplate putting up more substantial machinery.

DOING BETTER.—Ten men are at work at the Nevada City mine now, says the *Herald*, and we hear that the prospects are brightening. The ledge, which has a split, "makes" again, and the ore is good.

Plumas.

PLUMAS IMPERIAL.—*Independent:* Supt. McGilvary of the Plumas Imperial mine says that a monitor can be run three or four hours each day.

GREEN MOUNTAIN.—At the Green Mountain there are thirty stamps at work and preparations are being made for setting up fifteen additional.

San Diego.

NEW FINDS.—A vein of gold ore has been developed five miles southeast of Alpine. It is six feet wide and produces $10 to the ton.

A gold vein five feet wide has been discovered near Dehesa. It runs $13 per ton.

EXTENSIVE OPERATIONS.—Regarding the recent mine sales reported in these columns, the Yuma *Sentinel* says that Senator Dorsey and his associates will at once complete their plans for building a narrow-gauge railroad from the mines to the Colorado river at Picacho, four and one-half miles, and for building a 100-stamp mill, both of which will be done this winter. Senator Dorsey and Mr. Farrish are of the opinion that ore enough can be taken from the Picacho mines to constantly supply a 1000-stamp mill. Jesse R. Grant, who accompanied them, bonded thirty mines in the White Gold basin, one mile east of Picacho, which he will open at once, and to work the ores of which he will put up a 100-stamp mill on the river.

Shasta.

MOUNTAIN MINES CO.—*Courier:* Work on the Iron Mountain railroad is progressing very fast, the track being laid for a distance of four or five miles from the mouth of Spring creek, and construction trains are being run as far as Flat creek every day and night. A large force of men are still employed, probably 1500. It is estimated that over 5,000 different laborers have been employed there the past few months, many working only a week or two and quitting, their places being immediately filled by others. Many new buildings have been erected at Keswick and it now has the appearance of quite a little town. Work on the smelter is fairly under way and the company is preparing to have their electric plants in operation in a short time.

THE GLADSTONE.—Men were to work on the Gladstone this week.

THE NIAGARA.—At the Niagara about fifty men are on the payroll.

MINES BONDED.—D. B. Hunt has bonded the Tom Greene and J. I. C. mines of Mrs. M. L. Fox, et. al. These mines are two of the most promiuent in the French Gulch section.

Sierra.

GENERAL NOTES.—*Messenger:* Owing to the scarcity of water the Pioneer mine, at Grass Flat, is about to lay off a large number of men.

The Chipps mine has shut down for the winter.

In running the Sacred Mound tunnel the ledge is getting wider and prospects well.

A force of men is opening up the Bigelow tunnel.

Copeland & Wehe have closed the sale of the Northern Belle quartz mine owned by Wm. Swan.

Jas. Nohlet has several men retimbering the incline shaft at the Marguerite mine.

Siskiyou.

GENERAL NOTES.—*Journal:* Scbeld & Steele have finished building their arrastra at the claim on Long Gulch, and it will he kept busy in the future crushing their ore. As more power is required, they will have an engine.

A tunnel is being run on the old Spencer quartz mine, at north fork of Humhug, to strike the lode 400 feet deep, where it is expected a permanent ledge will be found. The work will be continued during the winter.

The hydraulic miners all along the Klamath river, since the snowstorm of last Saturday, will soon he able to commeuce operations. On the high ridges the snow ranges from one to two feet deep, and the ground in the low valley sections is covered to the extent of at least two or three inches, to afford a good supply of water, with prospects of more storms before New Years.

Lamb's quartz mill is busy this week crushing ore from the Bailey & Carrick mine on Greenhorn.

At the Boyle mine they have three men employed doing assessment work. Arrangements will probahly he made soon so this mine can he worked on an extensive scale.

Work on the Blue Gravel claim at Greenhorn, which has been closed down for a number of months past, was resumed last Saturday and will he continued all winter. It will take several days to pump the water out of the mine, after which a day and night force will he kept constantly at work. There will be ahout eight men on each shift.

Tuolumne.

GENERAL NOTES.—*Independent:* A ten-stamp mill will soon he erected at the Louisiana mine.

The new twenty-stamp mill at the App is nearing completion.

The Golden Gate mine was shut down this week for lack of water for power.

On Sunday the new machinery at the Star mine was set in motion for the first time and worked in a highly satisfactory manner. On Monday the new ten-stamp mill commenced crushing ore. It is a first-class mill and can be run by either steam or water power.

THE LOUISIANA.—*Banner:* Lumber is being delivered at the Louisiana mine, hetween Cherokee and Soulsbyville, for a ten-stamp mill. At present the battery will consist of five stamps. The shaft is down 360 feet at the bottom; there is a vein from twelve to sixty inches. W. A. Hall is manager of the property.

Yuba.

THE OLD TEMPLAR MINE.—J. E. Poingdestre and others of Nevada City are developing the old Templar mine, now called the Goodtitle, which is located in Yuba county, about three miles from Dobbins' ranch. This mine was worked about fifteen years ago, and considerable gold was extracted from it. But it was abandoned, like many old California mines that have since turned out good.

NEVADA.

THE OPHIR.—At the annual meeting Supt. Lyman reported that they have on hand in the ore house 193 tons of ore, the average assay value of which, per sample taken from the cars when raised to the surface, was $29.49 per ton. On the 250 level, which is worked through the central tunnel, they estimate they have stored in the drifts 120 tons of ore, the average assay value of which, per sample taken from the cars in the mine, was $39.58 per ton. This makes a total of 313 tons, averaging $33.35 per ton. Arrangements will soon be made to heneficiate this ore. As it is impregnated with some lead and some other base materials, it is proposed to have it crushed and concentrated and to ship concentrates to some suitable reduction works for extraction of the gold and silver contained in them.

Three years ago, when they were extracting ore from the 1465 level, there was saved 439 tons of ore of low grade, and it was hoisted from the mine and stored on the waste dump separate from the waste rock. This ore assayed from $8 to $12 per ton and was sold the past year for 50 cents per ton.

SAVAGE.—On the 950 level, in west crosscut 1, at a point 20 feet back from the face, they have started a north drift to prospect the quartz body passed through in the west crosscut, and advanced the same 25 feet in quartz of a low assay value. The west crosscut started in the north upraise is advanced 40 feet, passing through some streaks of fair grade ore; face in ore. The north upraise was advanced 7 feet, making its total length 65 feet. The east crosscut started in the north drift 85 feet north of the north upraise was advanced 38 feet, when it reached the east clay of ledge and was discontinued. Have also started an east crosscut in the north drift from the fourth floor of the north upraise at a point 40 feet north of the upraise, and same 10 feet; face in porphyry and quartz. They are doing some repair work throughout the mine. No ore has been hoisted during the week.

BEST & BELCHER.—800 level—East crosscut 3, started at a point in the main north drift, 360 feet from our south boundary, was advanced 6 feet; total length, 256 feet; face in hard porphyry.

We are still doing some necessary repairing on the 400 level.

In the Hale & Norcross mine on the 975 level the ore streak which they are stoping upon in upraises 1 and 2 continues to look the same as last reported. They extracted from the various openings during the last week 34 carloads of ore, the average assay value of which was $85.55 per ton.

In the Chollar mine, from the stopes above the 450 level, they extracted and shipped to the Nevada mill during the week 64 tons and 500 pounds of ore, the average battery sample of which assayed $30.65 per ton.

The yield of the Potosi mine for the week was 155 tons and 1100 pounds of ore from the stopes above the 550 level. The average battery assay was $25.94 per ton.

In the Alpha Con. mine the southwest drift from the west crosscut, 450 level, has been advanced 12 feet; total length, 42 feet. The face is in quartz, assaying $3 to $15 per ton. The raise in the southwest drift has been carried up 7 feet; total height, 24 feet. The roof is in quartz and porphyry, the quartz assaying $2.50 to $10 per ton. Work was suspended in this raise on account of tapping a stream of water, and as soon as the flow decreases, work will he resumed. Have started a north drift opposite the southwest drift in the ledge and advanced the same through quartz assaying $5 to $20 per ton. The face is in quartz.

BRUNSWICK LODE.—Shaft 1 on Hale & Norcross ground near the Chollar Company's north boundary has been sunk a distance of 18 feet on the incline, passing through porphyry, clay and quartz showing some value; total depth, 245 feet.

Shaft 2 on the boundary of the Con. California & Virginia and Best & Belcher Companies' grounds has been sunk 12 feet on the incline, passing through hard porphyry; total depth, 166 feet.

East crosscut 1 in Savage Company's tunnel, which was started at a point 400 feet from the mouth of the tunnel, has been extended 8 feet, passing through hard porphyry; total length, 142 feet. Work has been discontinued in this crosscut.

A west crosscut has been started from a point opposite where the east crosscut was started, and the same has been advanced 18 feet, passing through hard porphyry and quartz.

In the Occidental Consolidated mine, on the 550 level, the southwest drift is now in 128 feet. The face is a softer formation with seams of quartz carrying gold. 650 level—The north drift from northwest crosscut has been extended 12 feet; total length, 45 feet, and continues in ore of low grade. The upraise started in north drift is up 18 feet and is in ore assaying $17 per ton. The south drift from crosscut has been extended 12 feet through ore of fair quality. 750 level—The west crosscut from north drift, 310 feet north of the main winze, has been cleaned out 45 feet and has been advanced 3 feet in new ground; total length, 48 feet.

READY TO BEGIN.—*Enterprise:* The Kinkead Mining, Milling and Manufacturing Company, which is erecting a plant to work over the C. & C. waste dump, is about ready to commence operations. In two or three days their mill will commence a run on the stored ore which has already been extracted from the dump. The ore will be taken in at the top of the building and dumped into an ore bin of the capacity of 100 tons; thence it will be carried by the aid of self-feeders into the grinders. It is then discharged from the grinders through a forty-inch screen to the plates. From the plates it goes into the point boxes, the surplus water is discharged and the pulp carried out to the concentrators.

LINCOLN COUNTY.

THE APRIL FOOL MINE.—Work on the April Fool pipe line is progressing, water will flow through the pipe by February 1, 1896, says the De Lamar *Lode*. The company is now negotiating for a mill and negotiations will be concluded in the next thirty days. The upper and middle tunnels are being driven ahead.

OREGON.

SISKIYOU MINING CO.—From Capt. Geo. F. Wheeler, of the Siskiyou Mining Company, the *Mining Journal* learns that nothing will be done this winter in the matter of constructing a road to the coast from the copper mines, but the energies of the company will be bent towards getting out, reducing its copper ores and shipping its copper. A temporary arrangement has been made with the S. P. R. R. Co. whereby the copper will be shipped by rail to Galveston, and thence by water to New York, whence it will be transported to Baltimore where the Baltimore Copper Co. will handle it.

JOSEPHINE COUNTY.

MINE BONDED.—G. F. Wheeler, A. M. Brown and J. H. Simon have a bond on the Mountain Pride mining claim, located on the Yank ledge on Rogue river, near the mouth of Galice creek, for $30,000.

THE MAYBELLE.—G. A. Koch tells the *Mining Journal* that at the mines of the Maybelle Mining Company at the Gold Basin there are thirty men employed. About fifty animals are still used on the trail in packing. The men are busy building a five-foot flume about 1200 feet in length and sixty feet high, which, it is estimated, will furnish sufficient water for four giants, with a pressure of 125 feet. Next year it is contemplated to build twelve miles of additional flume, at a cost of about $15,000. Mr. Koch is of the opinion that the Gold Basin is a glacial wash deposited at three different periods. The surface for a distance of sixteen feet consists of a red gravel which is very rich in gold. Below this is a blue-gray gravel, not quite so rich on the whole, but containing rich streaks, and rich enough to pay well for working. Below this, again, and on the soft granite bed-rock lies the richest deposit of gravel. The total depth of the gravel is over 100 feet in the 300 acres embraced in the Basin. In about thirty days the work will be so far completed that piping can be commenced.

WASHINGTON.

SPECTACLE LAKE DISTRICT.—The Spectacle lake district, in Okanogan county, is attracting considerable attention and a large amount of development work is being done. On the Iron King the shaft is down thirty-five feet, and it is the intention to sink fifteen feet farther and crosscut to the hanging wall. The Jack Rabbit is showing up ore similar in character to that of the Iron King, assays from the surface showing it is said, value of $45 in gold and nickel.

BRITISH COLUMBIA.

RAWHIDING WILL SOON BEGIN.—Nelson *Tribune:* The snow falls of last week have made rawhiding possible in Slocan district, and in various directions animals are being taken to the mines. The Goodenough has two carloads ready for shipment, which will be sent to the smelter at Pilot Bay. On the south fork of Kaslo creek the owners of the Gibson will bring down a carload, which will also go to Pilot Bay. The Slocan Boy will also ship at an early day. The large properties will also rush forward to an early market the output of several months.

REDUCTION WORKS FOR CARIBOO.—Cyanide reduction works, so it is reported, are to be erected on the Black Jack mine, near Barkerville, in Cariboo. The ore in that mine is of good grade, hut too rebellious to work profitably by free milling processes.

GENERAL MINING NOTES.—Rossland *Miner:* The Le Roi is raising 100 tons a day and there are not wagons enough to haul it.

On the Cliff, after following a false vein, a narrow seam on the side of the drift was followed, and found to open into a good body of clean ore, running from fifteen to twenty per cent copper, $21 in gold, making a total value of $45 a ton.

The dispute about the Homestake is cleared away, and D. M. Linnard, acting for Vancouver parties who have a bond, has let a contract for hunk houses and for a road to connect with the existing wagon road. Double shifts have been put on at the shafts and ore will be shipped by the end of December. Last assays gave $12 in gold and nineteen ounces silver.

New Denver *Ledge:* Ten men are working on the Kalispel, Ten Mile creek.

The C. P. R. is giving carload rates for ten-ton shipments of ore from Rosebery to the coast smelters.

Midway *Advance:* Fourteen locations were recorded at Midway for the week ending Nov. 27th.

A force of men will he put on the Knob Hill and Old Ironsides, Greenwood camp.

On the Cariboo mine, Camp McKinney, twenty-five men are engaged, and some of

the best ore yet obtained is being run through the mill.

Mining Journal: The Underwood dredger at Quesnelle is ready for work. Mr. Youngs, of Pittsburg, is arranging to build another.

The large dredger on the Fraser river at Lytton is likely to start up soon. The small dredger of the Finch company has been doing well on Mormon Bar.

Mr. Clemes, the London mining expert, and Mr. Fraser, manager of the Bank of Montreal at New Westminster, have been from Big Bar to the mouth of the Chilcotin. They favor the building of a dredger.

Since the pump has been put in on the Vancouver, Lillooet, no difficulty has been experienced with water, and the shaft is down seventy feet and in wash gravel, and the men anticipate reaching bedrock soon. From the the bottom of the shaft a drift will be made to the Basin.

J. B. Hobson is on his way down from the Horse Fly. About $110,000 has been taken out this year, and it is not anticipated that the shareholders will be required to put up any more money, though this mine and the Cariboo will not be properly opened for a year or two longer.

Fort Steele *Prospector:* The Dibble group has been bonded by Wm. Sprague and Thos. Chisholm for $25,000 for one year, $5,000 in work to be done during that time. The ore being taken from the North Star runs 265 ounces in silver.

In the Moyea group Jas. Cronan is taking out ore running fifty-four ounces in silver and sixty-five per cent lead on the St. Eugene. About fifteen men are employed. On the Queen of the Hills and Moyea a tunnel has been run striking the ledge, which assays the same as the St. Eugene. Both the St. Eugene and St. Patrick, owned by one party, and the Lake Shore, Moyea and Queen of the Hills, owned by another, will have ore to ship next summer if communication can be had.

The Invicta Gold Mines, Ltd., has a property consisting of about a mile and a half of hill diggings on Wild Horse creek. There are feet of top loose gravel, thirty feet of red gravel, and forty feet of blue cement, all containing gold. Three ditches, about five miles long, convey 1,500 inches by which three monitors are worked, but larger ones will be used next summer. Nuggets from $5 to $10 are common, and one was got during the past summer weighing eight and one-half ounces and valued at $150. The estimated returns of past years have been $50,000.

ALASKA.

GENERAL NOTES.—*News*, Dec. 5: The Mexican mine is now using steam power instead of water on account of the shortage of the latter.

The rails for the extension of the Treadwell railroad to the Ready Bullion arrived on the Al-Ki. Work will be begun in a few days laying the iron.

The scarcity of water at Treadwell's has necessitated the closing down of the compressor, thereby laying off a number of men for a short time.

C. W. Garside is surveying on the Takou group of claims recently bought by W. Ebner and will run a line for a new tramway. Development work will continue on this group of claims all winter. A tunnel is to be driven which will tap the veins at a much lower depth than that which is now being worked.

The tunnel on the 400-foot claim between Treadwell's and the Mexican is now in 190 feet. A track will be put down the latter part of the week and tram cars will succeed the wheelbarrows formerly used. The tunnel will be driven fully 1,000 feet farther before the vein is tapped.

Work on the old Bennett mine, the Aurora, has ceased for the winter. Since E. S. Holden began operations, buying the ore from Lutes & Bonnifield and milling it in the small Ebner mill, the success of the property has been marked.

UTAH.

PARK DISTRICT.

A GOOD SHOWING.—*Record:* There has been mined and shipped from the camp in '95 to date ores, including Crescent shipments, to the amount of 92,507,169 pounds; reduced to tons, gives over 46,252 short tons. The rate on ore from Park City to Denver is $7 per ton, and to Salt Lake $2; hence, considering the manner in which ore is divided, an average figure would be $6 per ton on all rock handled. That would give the railroads a business amounting to $277,512 on one class of freight alone, to say nothing of the coal, timbers, machinery and merchandise of all kinds that go to make up the necessary supplies for a mining camp. For dull times we consider the showing a very good one.

WORTH A MILLION.—The suit of the Marian Gold and Silver Mining Co. against M. T. Gishorn, involving the title to certain mining claims in the Camp Floyd district, valued at about $1,000,000, was decided by Judge Merritt at Salt Lake this week in favor of Gisborn.

IDAHO.

NEAR WANETA.—S. W. Cowan, of the Kootenay Water Supply Company, speaking of the operations of his company on the Pend d'Oreille river, near Waneta, and adjacent country says: "We have taken out of the Pend d'Oreille river 2000 horse power by constructing a wing dam at Seven Mile creek, seven miles from the Columbia river, and have constructed south of the falls on Seven Mile creek a flume seventeen feet square and are now placing three fifty-four-inch Leffel wheels and three rotary pumps with a capacity of 12,000 gallons a minute. The purpose of this work is to put 20,000,000 gallons of water on 1100 acres of placer ground on the north side of the Pend d'Oreille. The mining operations will be conducted under a twenty-one-foot head ninety-foot pressure, and three giants will be used—one five-inch, one four-inch and one two and a half inches, and it is expected that the work of hydraulicking will commence by the 15th of March. We have spent $10,000 in thoroughly prospecting the ground and from the best expert opinion the ground will yield twenty-five cents per cubic yard. The cost of washing the gravel will not exceed two to three cents." The manager is G. J. Goodbue. At present the offices are in Rochester, N. Y., but will shortly be removed to New York City.

A BIG PLACER DEAL.—In the Cariboo district, Bingham county, the American Placer Company has sold its bars to Thomas & Sons of Chicago for $300,000. The bars have been worked for some time. Thomas and Sons' output was $40,000. The ground averages about seventy-five cents a cubic yard. In the same district the Oneida and Nealon quartz mines have been sold to Colorado men for $90,000. Eight gold-bearing quartz claims, the average value of the ore of which is only $8 a ton, have been bonded to Chicago men for $150,000.

SOUTH DAKOTA.

NEW CORPORATION.—*Journal:* Articles of incorporation were filed at Pierre on Tuesday last, for the Holy Terror Mining Company and the Milwaukee Mining and Milling Company, the former with a capital stock of $300,000 and the latter at $100,000, at shares of $1 each. Headquarters for each company are at Milwaukee, Wis., and Keystone, S. D. The incorporators are J. S. George, C. M. Kipp, Milwaukee; and J. J. Fayel, Keystone.

COLORADO.

"QUEER THINGS IN CRIPPLE CREEK."—*Mail:* If you are not a guest at the hotel you are charged fifty cents for the use of a chair for a few minutes.

Barber chairs are converted into beds at night and bring from 75 cents to $1.50 each per night.

Pasteboard houses costing about $15 rent for $20 per month.

Miners and millionaires hobnob together.

Ore thieves, who work as miners, often carry away from $10 to $100 per day in their dinner pails.

People are walking the streets night and day because they can find neither place to rest or sleep.

Jim Crow men are passing themselves off as mining experts.

THE NEWTON COMPANY ASSIGNS.—The Newton Milling and Sampling Company of Idaho Springs made an assignment last week to John G. Ogden for the benefit of the creditors of the company. The assets are given at $9,938.09. The liabilities are placed at $8,617.08.

ARIZONA.

THE CEDAR VALLEY CO.—*Oasis:* The Cedar Valley Gold and Silver Mining Company, operating in Mojave county, about eighty miles from Kingman, near the Big Sandy river, are doing much to develop the mining resources of that county. In their mines at Cedar they have ninety men at work, and with a force of 100 men they are building a good road over the mountains to connect with the county road to Yucca, a station on the Atlantic & Pacific railroad, which place will be their railroad headquarters. The mine is now and has been for some time producing a rich gold and silver ore from a well defined, continuous vein. The ore is being hunched at the mine to await the erection of a large mill by the company which will be brought in just as soon as the road is completed. This company is composed of wealthy Pennsylvania gentlemen.

PROPERTY BONDED.—John Brockman of Silver City, N. M., has an option on the Pearce group of mines, near Tombstone, till January 1st, '96. The price agreed upon is locally said to be $500,000. These mines, six in number, were located last February. The owners commenced the work of development and the shipment of ore at once, and have continued steadily working and shipping ever since. The ore in places runs very high; the average, however, is 80 ounces in silver and 1 ounce in gold. The average width of the ledge is 40 feet. The shaft is down to a depth of 50 feet and there are two drifts running in opposite directions of 60 feet each.

MICHIGAN.

COPPER MINES AND DIVIDENDS.—The Calumet & Hecla Co. paid a dividend of $5 per share, on the 18th. This is the fourth dividend of $5 this year, and brings the total dividends up to $44,350,000. The Calumet & Hecla's October output was the largest in its history, being about 9,000,000 pounds of refined copper. This represents the amount smelted during the month.

At the Tamarack Mining Co. the output of stamp rock is returned at about 1400 tons a day, and the production of refined copper now approximates 1,500,000 pounds per month. The depth in feet of the several shafts is as follows, viz.: No. 1, about 3000; No. 2, 3500; No. 3, 4300; and No. 4, 5500. The new No. 5 shaft is now down 75 feet, and it is not expected to be completed until the year 1900. The width of vein rock in each shaft is said to be from 20 to 26 feet. The Tamarack has paid in dividends $4,470,000, including one of $4 per share or $200,000, to be dishursed on the 31st inst.

The Quincy Mining Co. has sunk shafts Nos. 2 and 4 about 3800 feet, and No. 6 about 3500 feet. The character of the vein in each shaft is the same as heretofore, and with five heads of stamps employed the company produced in October 850 tons of mineral, or about 1,344,000 pounds copper. The Quincy produced in 1894 15,484,014 pounds of refined copper, and the production of 1895 will not show any very pronounced increase. The company has paid in dividends this year $600,000, making a total of $7,670,000 since its organization. Since the beginning of operations at this mine to date the total output of refined copper is close in the neighborhood of 180,000,000 pounds, valued at about $28,305,428, including silver, allowing only 10 cents per pound for the last eleven months' production. The paid-in capital stock amounts to $200,000, and the company has expended on real estate, improvements, machinery, plant, etc, over two million and a quarter dollars.

Two Worthy Measures.

The following, furnished by Chairman T. L. Ford, of the Legislative Committee of the California Miners' Association, are two measures that will shortly be introduced in Congress, and which deserve the hearty support of every one in the State directly or indirectly interested in mining:

A BILL TO AMEND CHAPTER SIX, OF TITLE THIRTY-TWO, OF THE REVISED STATUTES, RELATING TO MINERAL LANDS AND MINING RESOURCES.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

SECTION 1. That section twenty-three hundred and twenty-four of the Revised Statutes be amended so that the same shall read as follows:

"SEC. 2324. Miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which it is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. such marking to include one post or monument at each corner of the claim. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than $100 worth of labor shall be performed or improvements made during each year.

"Where such claims are held in common, such expenditures may be made upon any one claim by any work or improvements tending to develop any of such claims. The period within which the work required to be done annually on mineral claims is to be performed shall commence at 12 o'clock meridian on the first day of January succeeding the day of location of such claim.

"When the labor required by this Act shall have been performed, or the improvements made, an affidavit may be filed within thirty days after the time limited for the performance of such labor, or making of such improvements, with the Recorder of Deeds in the county in which the claim or mine is situated, particularly describing the labor performed, and the improvements made, and the value thereof, which affidavit shall be *prima facie* evidence of the facts therein stated; and upon a failure to comply with the conditions of this Act, in the performance of labor or the making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location had ever been made; provided, that the original locators, their heirs, assigns or legal representatives, do not resume work upon the claim after such failure, and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditure required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditure. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the Recorder of Deeds in the county in which such mining claim is situated, shall be *prima facie* evidence of the acquisition of title of such co-owners. Where a person or company has run or may run a tunnel, or constructed roads or trails, for the purpose of developing a claim or claims owned by said person or company, the money so expended in running said tunnel or constructing said roads or trails shall be taken and considered as expended on said claim or claims; provided, further, that said claim or claims shall be distinctly marked on the surface, as provided in this Act."

SEC. 2. That section twenty-three hundred and twenty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 3. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read as follows:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in the State or Territory where the claims may be situated, having an official seal, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, attested by his seal of office, shall have the same force and effect as if taken before the Register and Receiver of the Land Office. Whenever any contest shall arise as to the mineral character of any land claimed to be subject to entry or sale under an Act of Congress, all proceedings shall be stayed until the controversy shall have been settled or determined by a court of competent jurisdiction in the county where such land is situated, or the contest withdrawn; and it shall be the duty of the Register of the Land Office in which such contest is made to immediately certify such contest to such court, and to immediately notify the contestant and contestee thereof.

Within thirty days after filing such contest, the contestant shall file in such court a verified statement of the facts upon which he bases his contest, in plain and concise language, and shall serve the same upon the contestee; and thereafter, and within the time provided by the laws of the State or Territory where such land is situated, for answering in any civil action, the contestee shall file his verified answer to such statement, and thereupon the contest shall be tried and determined as are ordinary actions in such court; and, when determined, such determination shall be certified to the Register, and such determination shall be binding upon him, and shall be forever conclusive as to the character of the land in question; provided, that the presence of rock, earth or gravel, bearing gold, silver, cinnabar, petroleum or other valuable mineral, shall be regarded as *prima facie* evidence that the land containing the same is mineral in character; and provided, further, that in investigating the character of land with a view to ascertaining whether it is more valuable for mineral than for agricultural purposes, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be taken as presumptive evidence that the land in question is mineral in character; and provided, further, that wherever land is proven to be within a well-defined mineral belt, such land shall be deemed, presumed and taken to be mineral land, unless the contrary is proven; and provided, further, that the provisions of this chapter shall be liberally construed, with a view to aid the applicant in procuring title to the mineral lands of the United States, and that the rules and regulations prescribed by the Land Department for its government and that of its officers, in disposing of said lands, shall be so formulated and administered as to assist the Government in disposing of said lands to *bona fide* applicants; and provided, further, that all applicants for patent for lands, upon which exists a valid mining location, the notice of location of which, designating the section and township in which such location is situated, shall have been recorded in the office of the Recorder of Deeds of the county wherein the land in question is situated, must, except when otherwise in this act provided, give to such mineral claimant notice of such application in writing, or by publication in the newspaper published nearest such mining location, at least once a week for sixty days."

SEC. 4. That Section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended to be used or occupied, by the proprietor of such vein or lode claim for mining or mineral purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately, subject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims; but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superfices of the lode claim. The owner of a quartz mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill site as provided in this chapter."

A BILL TO APPROPRIATE MONEY FOR THE CONSTRUCTION OF WORKS TO IMPOUND MINING DEBRIS, AND THEREBY TO PROTECT THE NAVIGABLE STREAMS OF CALIFORNIA.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress Assembled.

SECTION 1. That there is hereby appropriated out of any money in the treasury not otherwise appropriated the sum of one million and thirty thousand dollars, which sum shall be immediately available and shall be expended under the direction of the Secretary of War, in accordance with the plans, specifications and recommendations of the California Debris Commission, appointed under the Act of Congress entitled, "An Act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, for the purpose of constructing works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in California and the branches of such tributaries.

SEC. 2. Whenever any such works for the restraining and impounding of mining debris shall have been constructed out of such appropriation, or shall have reached such a stage as, in the opinion of such commission, it shall be safe to use the same, it shall be lawful for such commission to make the order provided for in section 13 of said act, upon proceedings being first had and taken in accordance with the provisions of sections 9, 11 and 12 of said act, but in such cases the owners of the mines affected by said orders shall not be bound by the proviso to said section 13 of said act nor by the provisions contained in section 16 thereof.

SEC. 3. The said commission shall also have the power to make the order provided for in section 13 of said act as to any mine or mines whenever it shall appear to the satisfaction of said commission that no impounding works are necessary other than the means already provided by nature to protect from material injury the navigable streams mentioned in said act and the land adjacent thereto, upon proceedings had in accordance with sections 9, 10 and 12 of said act.

Coast Industrial Notes.

—Building permits for '95 in Los Angeles aggregate nearly $4,000,000.

—Kimball, Phillips & Malot, of San Diego, have given a sixty days' option on the Verde antique marble property to Alameda properties for $225,000.

—Colonel Charles F. Crocker is going to start a coffee plantation in the San Joaquin valley. The San Juan brought from Central America 1000 yearling plants, which will he set out this fall.

—Last Monday's edition of the Oakland, Cal., *Daily Times* was a splendidly illustrated one, making a fine showing of the industries and attractions of the city fortunate enough to have so enterprising an exponent.

—The Minneapolis Trust Company has bought a controlling interest in the Seattle, Wash., Gas and Electric Light Company. The company has a capital stock of $600,000 and a bonded indebtedness of $750,000, the Minneapolis Trust Company being the holder of about $400,000 of the bonds.

—The price of beets at the Chino sugar factory for '96 is on a basis of $3 per ton, with an additional 25 cents for each percentage of sugar contained in the beets above 12 per cent. This year the average price paid for all beets was 80 cents a ton above the basis price, or $4.30 a ton. The same percentage of sugar with the '96 basis would make the price $3.80 a ton.

—For the first eleven months of '95 flour exports from San Francisco aggregated 859,500 barrels, against 706,270 barrels during the same period in 1894. Putting this on a wheat basis, and adding it to the exported wheat, gives total exports of wheat during the eleven months of 12,600,100 ctls., valued at $11,891,200, against 8,583,300 ctls. at $8,133,400 during the same time in 1894.

—The arrival in London is noted of a large consignment of frozen salmon from British Columbia, in good condition and of excellent flavor, notwithstanding the fact that they were taken months ago and were sent to London via Australia, a distance of something like 22,000 miles. It is believed that the cost of importing frozen salmon into England is too heavy to allow of the fish to he sold at a sufficiently low figure to eommand general sale.

—A well-known Portland merchant has recently had illustrated to him, in the persons of two commercial travelers, great vicissitudes of fortunes. One, who called to solicit trade for a certain hrand of catsup, was at one time one of the leading merchants of Boston, and his residence, when adversity came, sold under the hammer for $73,000. The other, who had a line of cigars, had heen twice elected Governor of one of the largest Western States.

—The scheme to huild an all-rail route through British Columbia into Alaska is again heing discussed. This time it is to go hy way of Kamloops, the North Thompson and Barkerville, through the heart of Carlhoo. The distance to Barkerville from Kamloops is ahout 350 miles. Such a line would he of advantage. But if such a road is to he huilt it will he hy the Canadian Pacific Railway Company, for the construction of which line a charter is already held.

—The new Howe truss hridge spanning the Sacramento river eontains 1,100,000 feet of lumher, and cost for lahor and material $130,000. The hridge consists of four spans and a draw. Three of these spans are each 150 feet long, one is 125 feet, and the draw is 236 feet. The latter will he operated hy an electric motor with automatic gates for the roadway, which gates will open or close as the draw is moved. It will also he equipped with hand machinery, to he used in case of accident to the automatic apparatus.

—The Pacific Mail Steamship Co. and the Panama Railroad Co. have come to a traffic agreement which insures a continuous line hetween New York and this city, the steamers on the Atlantic side to he run hy the Panama Railroad Co. and those on this side owned and operated hy the Pacific Mail, which last company has the monopoly of waterway traffic on the Pacific side; the Pacific Mail gets 45% of the through traffic, the Panama railroad 45%. The Pacific Mail's three Atlantic steamers will he brought round the Horn.

—The California Oil and Transportation Company is organizing in Los Angeles hy law to purchase from Charles Nelson of this city the lumher harge, Enoch Talbot, and, with that hoat as a nucleus, organize a line of oil steamers for coast transportation. It is the intention to huild a 12,000-harrel tank at the San Pedro wharf for the storage of oil until it can he loaded on the harge. The objective point will he San Francisco. The company has no business connection with the Oil Exchange, though some of the members of the Exchauge are interested in it.

—The flour combine includes, under the name of the "Sperry Flour Company," the following mills: The Pioneer mill, Sacramento (ruuning); the Sacramento (closed); mill at Sheridan, Placer Co. (closed); Wheatland mill (closed); Buckeye mill, Marysville (ruuing; Gridley, Butte Co., mill (closed); mill at Chico (running); two mills at Stockton, including the Sperry (running); Golden Gate mills, this city (closed). The Sperry Company's mills also include those of the Central Milling Company, extendiug over the central and southern part of the State. The chief result of the combination has heen the retention of the China trade.

—Secretary of the Navy Herhert will award the construction of one of the two new hattleships to the Union Iron Works of this city, the recent hid to he modified. That hid was for $2,640,000; the Cramps of Philadelphia hid $2,750,000; the Newport News Shipbuilding Co, hid $2,250,000. The Government recognizes the advisahility of constructing one of the vessels here, and proposes that the plans and price he modified; the result will undoubtedly be that the compromise will he made, the plans changed to conform to all conditions, the price modified proportionately and the contract awarded to the local firm in final accordance with the act of Congress authorizing the expenditure.

Personal.

JAS. TREADWELL is examining mining properties in Amador Co.

C. B. WINGATE, of the Thistle mine, Sierra Co., has returned to Scotland.

JOHN MCMURRY, of Trinity, left for Washington via Kentucky, last Sunday.

H. BANKERT has been appointed manager of the Promontorie mine, Durango, Mexico.

R. C. CHAMBERS has heen elected president of Salt Lake Utah's, first Mining Exchange.

W. C. MCCOY, of Auhurn is now superintendent of the Hasskell or Gaylord gravel mine.

G. M. ROBERTS, chief assayer at the Broken Hill Proprietary (Australia), has resigned and will go to Coolgardie.

J. H. TIBBETTS arrived at Buluwayo, Mataheleland, South Africa, on the 9th inst. One word wired from there costs $3.80.

SUPERINTENDENT SMITH, of the Bonanza mine, Sierra Co., has assumed the superintendency of a Cripple Creek, Col., property.

A. H. ROLLINS and George Marks, representing the Copper Queen Co. of Arizona, are examining properties in Skagit Co., Wash.

MR. PAUL JOHNSON, superintendent of the Hall mines, Nelson, B. C., says the fires will be lighted in the smelter on the 1st of January.

F. W. EDELSTEN, editor and proprietor of *The Bullion*, is here, and reports considerahle life in the mining industry in southern California.

C. A. MONKOVSKY, a Russian mining and railroad engineer, is iu the State securing mining statistics and information for his Government.

FRANKLIN LEONARD, of New York, president of the Comstock Tunnel Co., was in the city during the week, and says he will winter on the Comstock.

HERBERT BARTLETT, the Washington State expert has heen exploring Nehraska and declares the discovery of gravel elaims there "fahulously rich in gold."

"BARNEY BARNATO, the Kaffir King," is announced to shortly visit Colorado, where, it is helieved, should he desire to invest in mines, no local objection would he sustained.

HON. T. L. FORD of this city has heen selected hy the Executive Committee of the Miners' Association to go to Washington in the interest of necessary national legislation.

MAJOR FRANK MCLAUGHLIN, of Butte Co., has sold to his English associates all his interests in the River Claim, Butterfly, Banner, Mineral Slide, and Rock River in that county, and will take a well-earned rest, prior to the development of other projects.

A Question Answered.

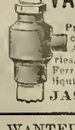
TO THE EDITOR:—In last week's issue you have an article on assessment work. It is clear to me, hut I have some friends who are placer mining (they have eight claims—160 acres), and say that the only assessment required is $100 for the whole 160 acres. Should it not he $800 worth of work—either $100 on each claim or $800 on one, if for henefit of others? By answering this through your valuable paper, you will greatly ohlige

Fresno, Cal., Dec. 16, '95. A SUBSCRIBER.

[Work or improvement to the value of $100 is required on each claim. If, in the case specified, the whole $800, in such work or improvement, can he proved to he for the joint henefit or development or working of the entire group of eight claims, the amount ($800) can he expended on any one of those aggregated claims. In all such cases there must he $100 expended for each 20-acre claim.]

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION.



532 California St., corner Webh.

For the half year ending with the 31st of December, 1895, a dividend has been declared at the rate per annum of four and thirty-two one-hundredths (4 32-100) per cent on term deposits, and three and six-tenths (3 6-10) per cent on ordinary deposits, free of taxes; payable on and after Thursday, the 2nd day of January, 1896.

LOVELL WHITE, Cashier.

VAN DUZEN STEAM JET PUMPS

THE BEST IN THE WORLD.

Pumps any Kind of Liquid. Always in order. Never clogs nor freezes. Fully Guaranteed. COST $7 AND UPWARD. Especially useful for Mines, Quarries, Pits, Wells, Clay Pits, Breweries, on Steamships, Ferryboats or any place where steam is available and liquid to be pumped. A full supply in stock. Address,

JAS. LINFORTH, 37 Market St., S. F.

WANTED.—A FIRST-CLASS MINING BLACKsmith wants employment; can do lathe or machine work, build mining cars, understands Burleigh drills and compressor; good references. Address, CHARLES WILLIAMS, 420 Thirteenth street, Sacramento.

Annual Mining Company Meetings.

At the annual meeting of the Mount Diablo Mill and Mining Company 39,132 of the 50,000 shares of the capital stock were represented, and J. M. Shotwell, J. N. Knowles, Louis Tesse Jr., John Tunningsen and R. W. Heath were elected directors. J. M. Shotwell was elected president and R. W. Heath secretary. The company has a cash balance of $1599.49 in the bank.

At the annual meeting of the Andes Mining Company 81,395 shares were represented, and the following officers elected: President, Nat T. Messer; vice-president, Gus E. L. Parker; directors, W. S. Lyle, W. Edwards and H. Zadig. John W. Twiggs was re-elected secretary and Joseph Ryan superiutendent. The secretary's financial statement showed a credit of $3727.12.

At the annual meeting of the Kentuck Mining Company, 70,128 shares were represented, and the following officers elected: President, R. E. Kelly; vice-president, H. Zadig; directors, S. Jacobs, W. H. H. Hart and Aug. Waterman. Aug. Waterman was re-elected secretary, and his financial statement showed a credit of $4364.94.

At the annual meeting of the Ophir Mining Company, 66,788 shares were represented, and the following officers elected: President, Charles H. Fish; vice-president, Nat T. Messer; directors, George B. Wells, A. W. Havens, John W. Twiggs, H. Zadig and Charles Hirshfeld. E. B. Holmes was re-elected secretary, and D. B. Lyman superintendent. The secretary's financial statement showed a credit of $11,722.37.

The Gould & Curry Mining Company, at its annual meeting, re-eleeted the old directors, with Henry B. Havens as president; Charles H. Fish, vice-president; A. K. Durhrow, secretary; Patrick Kervin, superintendent; and the Nevada Bank, treasurer. The numher of shares represented was 80,115. The company has an indehtedness of $781, with an assessment of 15c per share in process of collection. A resolution authorizing the superintendent to dispose of the old maehinery at the mouth of the Osbiston shaft was adopted.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 10, 1895.

551,178.—AMALGAMATOR—Bowes & Philbrick, S. F.
551,112.—SHEATHING—O. R. Dahl, Seattle, Wash.
550,953.—WEIGHING SCOOP—N. S. Douglas, Oakland, Cal.
551,272.—DISHCLEANER—Finlay & Wilson, Silverton, Or.
551,160.—HOWEL AND CROZE—Foertsch & Wilhelm, S. F.
551,185.—VOTING MACHINE—F. H. Gilbert, Ridgefield, Wash.
551,122.—SOLDERING MACHINE—M. Jensen, Astoria, Or.
550,982.—TELEPHONE SIGNAL—J. A. Lighthipe, S. F.
550,985.—CUPBOARD—Lowell & Fuller, S.F.
551,088.—PNEUMATIC TIRE—E. F. Murdock, Oakland, Cal.
551,092.—THILL COUPLING—G. J. Overshiner, San Diego, Cal.
551,045.—CPOTHESLINE—J. R. Phelps, Marysville, Cal.
551,145.—ELECTRIC RAILWAY SWITCH—A. Rosenholz, S. F.
551,235.—COMPASS—L. Sirleix, S. F.
551,059.—DISHCLEANER—M. Stone, San Diego, Cal.
551,246.—CHERRYSTONER—E. Zeitfuchs, Portland, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ABDOMINAL SUPPORTER.—Annie Babington, Oakland, Cal. No. 550,433. Dated Nov. 26, 1895. The object of this invention is to provide an abdominal supporter of novel construction which may either be used independently or in conjunction with an upward extension, forming a waist to surround and support the upper or bust portion of the body. It consists of a single continuous front portion fitting the abdomen, extending to the hips upon each side; independent back sections extending from the hips to near the center of the back, and provided at their meeting edges with eyelets; independent transverse elastic strips by which the adjacent edges of the back sections are permanently and yieldingly united; lacing strings hy which the adjacent edges of the front and back sections are detachably united on vertical side lines; and supplemental independently adjusting buckle straps and tahs uniting the front and back sections across the meeting side lines.

LIQUID-CONTAINING CANS.—Max L. Schleuter, Oakland, Cal. No. 550,696. Dated Dec. 3, 1895. The object of this invention is to provide an attachment for liquid-containing cans which will allow the liquid to be drawn from the can while a certain amount of vacuum is produced in the upper part hy reason of the pressure of the liquid to resist the admission of air to take its place as the liquid is heing drawn so that this vacuum, in connection with the nozzle through which the liquid is drawn, serves to check the flow of the liquid when the level in the vessel reaches the level of the air-admission pipe. It also provides for a free movement of the air in the upper part of the can when the discharge opening has heen closed so that any pressure from expansion of air within the can, caused hy heat, will he equalized and the surplus allowed to escape. It consists of a discharge passage with an extension or continuation therefrom exterior to and below the bottom of the can, a valve closing the inner end of the discharge passage with a stem extending upwardly through the top, and means for raising and depressing it to open or close the valve, a second valve fixed to the upper end of the stem to close upwardly against the seat in the top of the can when the discharge valve is opened, and to open when the discharge valve is closed, and an air pipe, one end of which opens in the can heneath the level of the discharge valve, and the other exterior to the can, said pipe containing a column of liquid which is continually overbalanced to allow air to enter when the discharge column fills the full length of its pipe, and which counterhalances the latter and prevents flow when the flowing column is less than the depth of the discharge pipe.

BICYCLE BELL ACTUATING BRAKES.—William A. Hay, San Francisco, Cal. No. 550,718. Dated Dec. 3, 1895. This invention relates to a combined brake and hell for hicycles and an actuating mechanism whereby the bell may be sounded or the hrake applied. It consists of a slidable rod, with means for moving it, a yoke at the lower end with a bell fixed therein, and a hammer or clapper suspended within the bell so as to he movahle to strike the bell when desired, a wheel having arms or cams, and a shaft journaled in the lower end of the yoke so that it is movahle when the yoke is depressed to bring it into contact with the bicycle wheel rim, the arms or cams acting when the wheel is rotated to operate the hammer and strike the hell. This wheel is so constructed that a further depression will partially lock it and cause it to roll with a frictional contact, which serves to check the speed of the bicycle wheel.

GATE.—Charley Albert Huffmaster, San Leandro, Cal. No. 550,720. Dated Dec. 3, 1895. This gate relates to that class which has wind vane attachments and adapted to assist in the opening and closing of the gate. The invention consists in combination with a gate of a wind vane attached to said gate, and means operated hy the person opening or closing the gate for operating or adjusting the vane to present either its full face or edge to the wind, according to the direction of the wind and the direction in which the gate is to he opened. The object of the invention is to provide a gate with a wind vane attachment adapted to be adjusted in such a manner that the gate may be readily opened with the assistance of the wind and closed again in the teeth of the wind with equal facility.

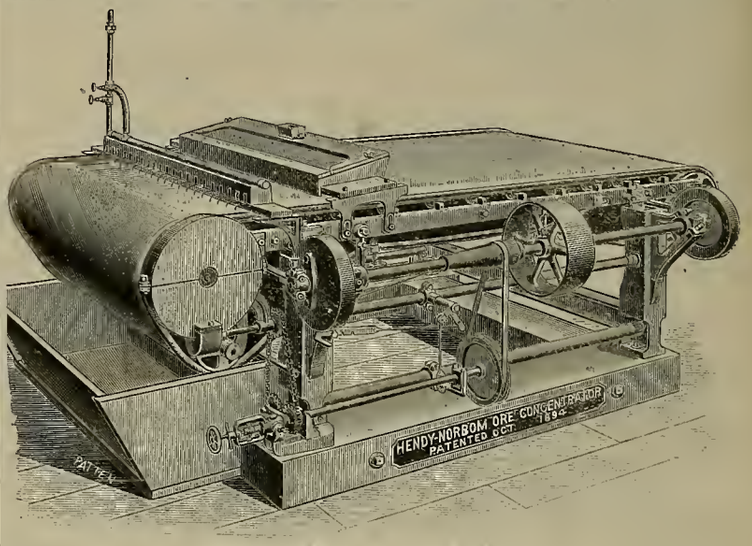
ADJUSTABLE IGNITER FOR EXPLOSIVE ENGINES.—Thomas G. Cantrell, San Francisco, Cal. No. 550,743. Dated Dec. 3, 1895. This invention relates to that class of igniting devices for explosive engines in which a movable electrode makes contact with a fixed electrode. The object of this invention is to provide a simple and effective means for adjusting the contact of the electrodes and varying the time of the explosion, it heing found of advantage, especially when the engine is running at high speed, to cause the explosion while the piston is still compressing, though when the engine first starts it is not advisable to do this. The invention consists of a fixed and a movahle electrode, mechanism for operating the movahle electrode and means, comprising intermeshing gears, one movable relatively to the other for adjusting said mechanism to vary the times of contact of the electrodes whereby the time of the explosions may he regulated.

ROTARY ENGINE.—John D. Keller, Santa Clara, Cal., assignor of one-half to Otto Leu of same place. No. 550,721. Dated Dec. 3, 1895. This invention relates to that class of rotary engines or rotary pumps in which radially slidahle pistons revolving concentrically with the interior of the shell are operated hy an eccentrically located cylinder which forms an ahutment at one side with the interior of the shell and a steam or water space on the other side. The invention consists in a shell having a main inlet passage, with branches leading therefrom and communicating at either side of the interior of the shell through passages, separate exhaust passages, valves in said branches controlling the exhaust passages and the passages leading to the interior of the shell, a cylinder within the shell forming an ahutment on one side therewith and a steam space at the other side, a sliding and an adjustable connection hetween the piston and cylinder, a main cut-off valve in the steam inlet intermeshing gears, one operating the cut-off valve and the other on the shaft center of the rotatahle cylinder.

COOPERS' COMBINED HOWEL AND CROZE.—Henry J. Foertsch and August H. Wilhelm, San Francisco, Cal. No. 551,160, Dated Dec. 10, 1895. This invention relates to the general class of coopers' tools, and especially to tbe tools hy which the howel and croze are made on the inside of harrels or casks. The invention consists in a combined howel and croze, the curved stock of which is provided with a socket adapted to receive the howel bit, and its holding key, said stock having also a second seat for the reception of the croze bits to lie in line with the howel bit, both the howel and croze hits projecting suitahly from the convex sole of the stock. The object of the invention is to provide a single implement adapted by one operation to form the howel and croze, therehy saving time and labor.

AMALGAMATOR.—A. Bowes and F. E. Philbrick, San Francisco. Dated Dec. 10, 1895. This invention relates to improvements in apparatus for amalgamating precious and valuahle metals. It consists essentially of a pan having the interior sides adapted to he amalgamated, dies removahly fixed in the bottom of the pan, shoes supported hy a stationary frame from ahove the pan, adapted to rest upon the dies, means wherehy the pan is caused to rotate heneath the non-revoluble shoes, horizontally extending arms secured to the frame work and from which the shoes are suspended, openings made in the side of the pan, a vertical passage into which said openings discharge extending below the hottom of the pan, an annular inclined discharge trough in line heneath the passage to receive the overflow and discharge from the pan as it rotates. A vertical shaft hy which the pan is driven has a step in the bottom which is provided with horizontal journals so that the pan may he tilted ahout these journals after the shoes and dies have been removed therefrom so as to he conveniently cleaned.

Books Received.



"Chemical Technology; Chemistry in Its Application to Arts and Manufactures," being Vol. II of the series. This book of 400 pages, with numerous illustrations, is deserving of most favorable mention. It treats of "The Special Application of Fuel to the Purpose of Producing Light" in a systematic way and gives much valuable information. "Fats and Oils," "Stearine Industry," "Candle Manufacture," "The Petroleum Industry and Lamps," "Miners' Safety Lamps," "Vegetable Fats and Oils," "Testing Oils and Fats," "Air Gas Machines and Carhurettors" are given exhaustive discussion, all being treated with direct practical reference to applied chemistry. The 145 pages devoted to the petroleum industry are of especial value to our readers in this State, the petroleum products of California heing second only in value to gold in the mineral production of '94. The price of the book is $4. It is published by P. Blakiston, Son & Co., 1012 Walnut St., Philadelphia.

MINING AND MILLING MACHINERY.

HENDY-NORBOM ORE CONCENTRATOR.

Office of ORLEANS MINING COMPANY, GRASS VALLEY, CAL., Dec. 12, 1895.

Mr. John O. Norbom, San Francisco, Cal.—DEAR SIR: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3¼ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen, which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly. [SIGNED] C. A. BROCKINGTON, Superintendent.

Office of FEDERAL LOAN MINING COMPANY, NEVADA CITY, CAL., Dec. 10, 1895.

Mr. John O. Norbom, San Francisco, Cal.—DEAR SIR: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly, [SIGNED] J. VINCENT, Superintendent.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 19, 1895.

The downward tendency in metals seems checked, yet buyers wait on the market. The drop in copper is believed to be but temporary. The depression in iron and steel is largely due to the usual dullness of the closing days of the year, no one caring to "load up" until after New Years. The market may he generally characterized as a waiting one. Regarding copper, Houston & Co. of New York say: "The dullness of the market here has been in marked contrast with the activity which has been of daily occurrence at the speculative center in London. Reported sales of G. M. B.'s in Novemher aggregated 21,910 tons, mostly time operations. Europe has also bought more freely of American copper since the decline, for deliveries well ahead. The recent heavy decrease in European stocks has been a marked feature in the foreign copper situation, and the finer grades have become so scarce that smelters have had to fall back upon Chili bars. Since August 1st, European visihle supply of copper has decreased 11,236 tons. With this heavy foreign demand, and a continuance of the present large consumption here, a turn in the market may occur when least expected. Imports of American copper into England and France from January 1st to about the middle of November were only 19,461 tons, against 29,597 tons during the corresponding period in 1894, and 37,693 tons in 1893. Between these dates deliveries of copper in these countries this year were 91,927 tons, or an increase of 8514 tons over 1894. Europe may now improve the opportunity to supply this deficiency hy liberal purchases of American copper at present low prices, and foreign buying may stimulate the home trade. With the transatlantic market which this country now nas for the product of its copper mines, a ready market awaits its output, although the question of price may not always be satisfactory.

The total visible supply of copper in England and France, and afloat thereto, Decemher 1st was 45,574 tons, as compared with 50,250 tons on November 1st, heing a decrease of 4676 tons during the month. Stocks of copper in public warehouses in England and France decreased during the past month 4462 tons.

Under date of the 2nd inst., Jas. Lewis & Son of Liverpool, England, say: The effect of the large decrease of 4502 tons in the public stocks of copper in England and France during the past month has heen neutralized by the large offerings of American copper of all kinds at very low prices—the equivalent of about 9.65 cents per pound having heen accepted for electrolytic. So long as this continues we cannot look for any permanent improvement in the market. Although the representatives of a number of large producing companies have sold very freely for some time past, other large producers appear to have sold hut little and will now probably have to accept still lower prices.

Good merchantable copper is to-day £2 5s per ton lower than a month ago. From £45 2s 6d on the 1st ult. cash fell to £43 10s on the 8th, advanced to £44 7s 6d on the 13th, declining again to £42 10s on the 20th, recovering to £43 10s on the 26th, and closing at £42 17s 6d per ton. About 27,000 tons have changed hands.

In sympathy with the lower prices at which American copper is offered, best selected ingots are now worth only £47, and tough cake £46 10s per ton.

Lake ingot is quoted nominally 10.87½ cents per pound.

In addition to a greatly increased consumption of copper wire for trolley cars in the United States, we learn that the Western Union Telegraph Company, during the year ending last June, added to its wire lines a length of 11,859 miles, of which over 10,000 miles were of copper, and they are replacing all defective iron wires with copper, the advantages of reduced weight, increased capacity for electrical transmission, and diminished liability to interruption from atmospheric conditions, more than compensating for the extra cost.

It is stated in the report of Hamilton Smith to the Exploration Company that annual dividends of $3,000,000 from the Anaconda Company's mines on a production of 50,000 tons fine copper per annum, or $60 per ton, can be reasonahly expected, even with a low range of prices for copper. Assuming this "low range" to he £40 per ton for good merchantable copper, the cost of production would appear to be ahout £28 per ton. There are sufficint reserves of ore estimated to he in sight for about three years' production at the rate of 50,000 tons of copper per annum.

From South Africa.

Lydenhurg correspondence South African *Mining Journal and Financial News*: Messrs. G. H. Starr, general manager of the Consolidated Goldfields, and Charles Butters, of the Rand Central Ore Reduction Co., passed through Lydenhurg on November 7th, on their return journey to the Rand, after a tour of inspection through De Kaap and Lydenhurg gold fields. The special object of Mr. Starr's visit was to inspect certaiu valuable mining properties owned hy the Goldfields of Lydenburg Co. at Belvedere, consisting of 5300 claims, which are distributed over a block of fifteen farms, on which active exploration and development are being diligently carried on, and mining operations are progressing satisfactorily.

The formation at Belvedere differs from that at Pilgrim's Rest in that the Belvedere reefs are found in the lower sandstone, whilst those farther south are in the dolomite and upper sandstone.

The Consolidated Goldfields are still acquiring farms and claims in the Lydenburg district from owners who are reasonahle in their demands and are not asking too fancy a price for their property.

The main object of Mr. Butters in visiting Pilgrim's Rest was that of thoroughly inspecting and overhauling the cyanide works at the Clewer, Theta and other well-known mines, and sampling their ores and residues with a view, it is understood, to the construction there, at an early date, of reduction works of the most approved type on a large scale.

MINING SHAREHOLDERS' DIRECTORY.

Compiled Every Thursday from Advertisements in the Mining and Scientific Press and Other San Francisco Journals.

Mining Share Market.

SAN FRANCISCO, Dec. 19, 1895.

The market was quiet and featureless the past week, creating some disappointment to those who looked for the supposed outside parties to take up another stock for an upmove. It would seem from the way in which the little spurts have been made that the manipulators are preparing for another spurt and then let go and let prices fall back again. It is safe to assert that the stock to he taken up will be the one that the outside public holds little of, so the move can be better managed. When moneyed men are in the market it makes but little difference whether the outside holds or not, for they are prepared to take everything thrown at them, even at high prices. But men having little money cannot, even hy combining, go beyond a certain limit. Then, again, outside pools or combinations have not the cohesiveness of a moneyed pool. This is due to the fact that one or more of the members work against the others hy buying shares unknown to them and then selling out just before or at the time the pool does. Of necessity this breaks a deal unless the other members of the pool can handle all the shares offered, when a corner can be run and hetter prices obtain by having secured large holdings and a short interest. Although the market looks bad and seems to be badly managed, yet there is an undertone which will bring about better prices before the first half of 1896 passes. This opinion is founded on the fact that when prices have been forced down around the midwinter holidays much higher prices followed in the months of April, May and June. As the market has heen kept down for months and large lines of shares secured from long holders, the usual spring deals under such circumstances can be looked for, and they may he run hy parties having more money than those who are reported to be manipulating the market now.

The news from the Comstock mines continues of the most favorable character, although the public do not recognize it, owing to the market not acting in sympathy. The work, as a rule, is be ng pushed in the direction for making important strikes. Some of the work was stopped just at the time when, by driving ahead for two or three days, an ore strike would have been made. That inside parties are not yet ready for these strikes is thoroughly apparent, as experience has taught that it is much better to find out how large the ore development will prove. Much of this kind of work is being done, which will unquestionably lead to the uncovering of large hodies of ore hefore another twelve-month rolls around.

In the Alta group the work is still in the right direction in Alta, hut it looks as if the management is trying to kill time, use up money and hring ahout an assessment before a strike will he made. The same remarks apply to some of the Gold Hill mines. In this group the work is towards the west in Seg. Belcher, Belcher and Crown Point. This work, if not stopped too soon, will strike the west lode. This lode is mostly gold-bearing, and averages from $40 to $80 a ton its full width, although streaks in it run over $1000 to the ton. It will take time after a strike has been made to develop the lode. In Overman, Kentuck and Yellow Jacket the work is kept from the public, or, at least, not published, which causes many to think there is something more important being done in them than the public is led to helieve. In Challenge and Confidence very little is reported to encourage the public, notwithstanding the work being done is uncovering an important hody of ore. It will probably require the striking of the ore on a lower level before anything much can be done with it to advantage.

In the Con. Imperial the work is being lazily pushed, evidently to get in another assessment before striking the ore found in Challenge and California. In Alpha a large flow of water is reported, which is accepted as a favorahle sign. In Bullion, Gould & Curry, and Best & Belcher the weekly reports continue unchanged. Something now ought to come to the front hefore many weeks pass by. In Potosi, Chollar, Hale & Norcross and Savage care seems to be taken not to have the work run into anything which will excite the cupidity of the public. In each of these mines veins and small leads of varying width are heing followed; by doing so time is consumed and the money used up. When they push west then strikes can he looked for. In Con. Virginia is where the most active work is reported and on several levels. It is the belief that when the powers that he see fit to have a hody or ore run into it can he done within a short time. At any rate the work now being done is putting the mine into excellent shape so as to take out more advantageously the ore found from the 1600-foot level down. On the 1000-foot level the work deserves close watching. In Ophir, Mexican, Union and Sierra Nevada the work is being closely watched by well-informed miners. They express the belief that before the end of 1896 very important results will follow the work now under way. In Ophir, Mexican and Union the work is on different levels, and towards the west. Andes, so far as the work is concerned, is not mentioned. On the Brunswick lode several shafts are heing sunk for the purpose of expediting work at a lower depth. Savage work on this lode is hoth of an exploiting and development character. Miners expect good results before six months pass. In the Occidental mine there is nothing of special interest to report. The belief prevails that something important will he run into before long—say inside of three or four months. From the Bodie district the news is uninteresting, and nothing of an important character is expected until work in Bodie is started and pushed on a much lower level thau they are now at work on. Where they are now working helps very materially in using up funds so as to levy another assessment. In the other mines in this district the work is essentially unchanged from that heretofore reported in this paper.

The following illustrates the changes of the week:

Assessment Notices.

CON. CALIFORNIA & VIRGINIA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 22d day of November, 1895, an assessment (No. 5) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the sixteenth (16th) day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of December, 1895, an assessment (No. 21), of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED R. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HITE GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the seventeenth day of December, 1895, an assessment (No. 2) of 10c (ten cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, Room 27, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. E. MATHEWS, Secretary.

Office—Room 27, 120 Sutter street, San Francisco, California.

DELINQUENT SALE NOTICE.

SUPERIOR MILL AND MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placerville, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 5th day of November, 1895, the several amounts set opposite the names of the respective shareholders as follows:

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on December 2, 1895, the above assessment is postponed to TUESDAY, the 31st day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Wm. A. Roberts and John Graham, in the Fore t Home mine, Amador county, to impound tailings behind a dam in Arkansas creek; from James F. Ish, in the Bull Neck mine, near Volcano, Amador county, to impound tailings in dry ravines; from Henry Dickerman et al., in the Mill Gulch mine, near Amador, Amador county, to impound tailings behind a dam below the mine; from John G. Ramm, in the Jay Bird mine, near Campionville, Yuba county, to impound tailings below the mine; from Schillanskey & Co., in the Wild Yankee mine, Shady Run, Placer county, to impound tailings behind a dam in a ravine; from W. H. Cole, in his mine in Mountain Tp., El Dorado county, to impound tailings behind dams in a dry ravine; from A. B. Jacks and John Clifford, in the Badger Hill mine, near Spanish Ranch, Plumas county, to impound tailings behind a dam in Woods Ravine; from John Schafer, in the Pin Leaf mine, near Spanish Ranch, Plumas county, to impound tailings in an old pit; from Geo. C. Sargent, in the Quaker Hill mine, Nevada county, to impound tailings on a flat south of Cherry Creek; from James Meeha , in his mine near Agneduct City, mador county, to impound tailings below the mine; from J. N. Findley, in the Trafton mine, near Yankee Jims, Placer county, to impound tailings in a ravine below the mine; and from George W. Smith, in the Irish Hill mine, near Oleta, Amador county, Cal., to impound tailings behind a dam in a ravine—gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Dec. 23rd, 1895, at 1:30 P. M.

SPECIAL MEETING.—A SPECIAL MEETING of the stockholders of the Sonora Extended Mining Corporation will be held at the office of the company, 213 Jackson street, San Francisco, California, on MONDAY, the 30th day of December, 1895 to consider and order on an offer to purchase the plant, the mine and other property of the corporation, and to authorize and empower the directors to sell the same, and to execute or cause to be executed a proper deed of conveyance of said property to the purchaser.

JOHN METCALFE, President.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS. 220 Market St., San Francisco.

Every Miner Wants It.

"The Sampling and Measurement of Ore Bodies in Mine Examinations."

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The need of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Anthmony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

BOOKS ON WORKING ORES.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 196 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

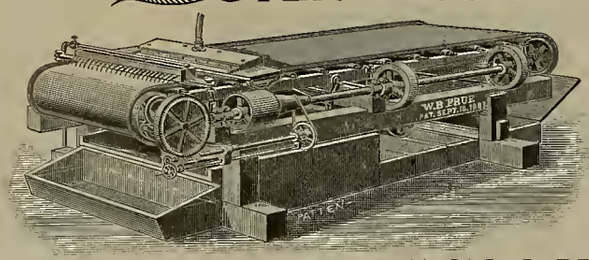
PRACTICAL HYDRAULICS.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.

By P. M. RANDALL.

This work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

TABLE OF CONTENTS.



The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Full per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels, Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

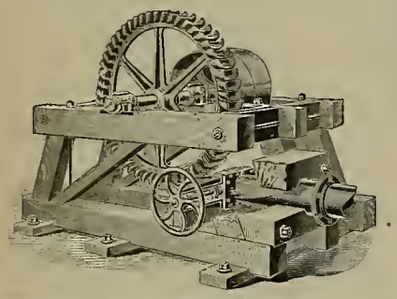
Price, $2.00, postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.



For any information, pamphlets, circulars or testimonials, call on or address

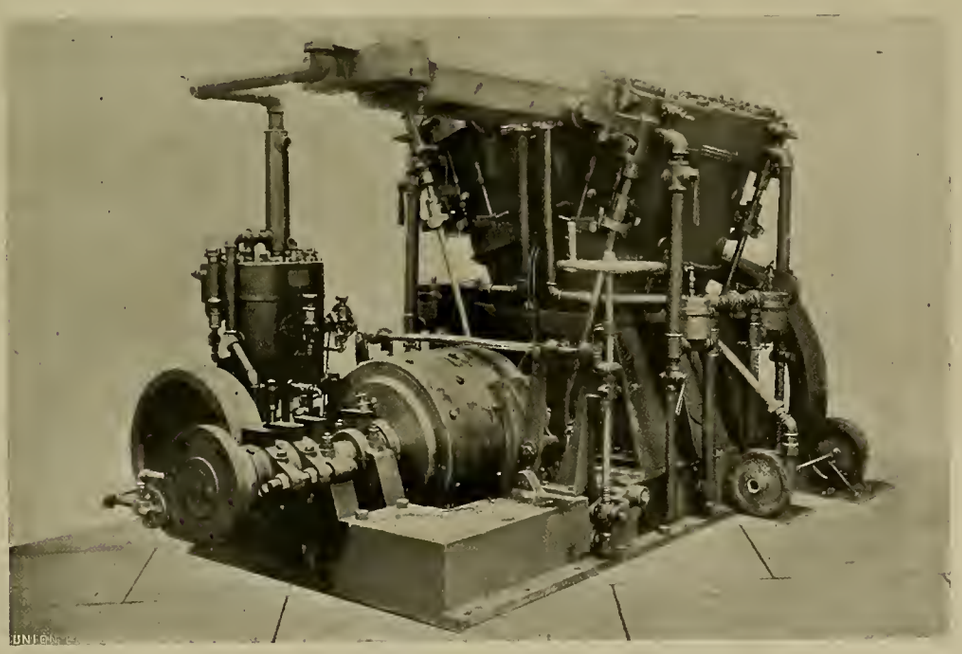
Gasoline Launch, Lucero.

Many accounts have been given of the gasoline yacht Lucero, built for Mr. Chas. L. Fair of this city, and owing to the variance of these accounts, this journal has concluded to give its readers an authentic description of tbe largest gasoline yacht in the world.



We illustrate herewith the engine and also the hull of this much advertised craft. The engine is of the four-cylinder, incliued type, and under the brake exerts 121 H. P. It has a direct connection from crank shaft to propeller shaft, that is, there is no intervening gearing, but it is coupled directly. Tbe reversing is accomplished through a differential gearing situated on the shaft, and tbe "go ahead," "stop" and "backward" motion is accomplished by one hand-wheel. Tbe hull is 100 feet over all, with an extreme beam of 16 feet 8 inches. The draft forward is 5 feet 8 inches, and aft 6 feet 8 inches. The length on water line is 82 feet. The frames are built of yellow bark oak, steam bent to shape; planking of vertical grain fir, in long lengths; deck of same material as planking; below water line fastenings are of Tobin bronze, balance galvanized iron; hull also shieved with copper below water line; stemband, rudder and shoe are of Tobin bronze; hull has pilot house and captain's room on deck, also three sky-lights, all of which are made of Brazilite, finished natural, and rubbed to a high polish.

All cabins and staterooms below deck, of which there are four, are finished in the same wood and style. All hardware is of polished brass, both on and below decks.

Tbe hull has also a bath and toilet room on board, and one diningroom with movable center tables and revolving chairs, and a seating capacity of eight people. Staterooms bave all the modern conveniences, such as closed lockers and drawers, wash stand and electric lights. Main parlor and saloon has settees on both sides, which can be changed into berths. All lockers have mirrors which set off the pannelling to great advantage. Galley and pantry are situated on the left. All cooking is done by electricity. The crew's quarters are forward of the engine-room and communicated with the deck by hatchway. Forward of the crew's quarters are situated the gasoline tanks, with a capacity of 2900 gallons. These tanks are made double, and every precaution has been taken to make them absolutely safe. The engine room is one solid tank of galvanized iron and asbestos sheeting. The hull was built in Seattle, Wash., by the Seattle Boat and Launch Building Co. The small engine shown on the rear of the frame is of 6 H. P., and is used for driviug the electric lighting and cooking appliances. It is also arranged so that the main engine can be started from it. The large engine occupies a space of six feet in width by ten feet in length and weigbs nine tons. On a run of sixty-eight hours the engine never beated or required any attention except oiling. The engine was built by the Union Gas Engine Co. of San Francisco, who are the oldest manufacturers of this power in America.

THE LAUNCH LUCERO ON THE WAYS.

ENGINE OF THE GASOLINE LAUNCH LUCERO.

Close of Volume LXXI.

This is tbe last issue of the seventy-first volume of this paper. It began its existence in May, 1860, and in the next six months will complete its 36th year. While age of itself is no claim to consideration, yet the Mining and Scientific Press believes it can say without any derogation of its own dignity that so many years of honorable and successful existence give any journal a prestige denied ephemeral publications. It is to be also borne in mind that that very fact constitutes a requirement that no paper can rest on laurels won, but must keep up with the times if not a little in advance. It is for our thousands of readers all over the country to say wbether such requirement is met. It can be truthfully said that at no period of its existence has it had a more prosperous outlook. It is our intention to make it merit the highest meed of prosperity, and it will be our endeavor to have it said of this paper that it is not only the oldest mining paper on the continent but the best. The table of contents for the last six months published elsewhere show the scope and character of its pages. Anything aud everything that directly or indirectly applies to mining, popular science, mechanical and general industry receives prompt and accurate notice. For the thirty-fifth time we wish our readers "A Happy New Year."

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Launch Lucero on the Ways; Engine of the Gasoline Launch Lucero, 421. Improvements in Engine and Dynamo Building, 428. The A. B. Frame Water Wheel; Frame Current Motor in Operation, 426.
EDITORIAL.—Gasoline Launch Lucero; Close of Volume LXXI, 421. The New Gas Acetylene; Notable Phase of Cheap Manufactures of Japan; Notable Discovery; Specimens of Pumice Stone; Attention Given to Gold Mining, 427.
MECHANICAL PROGRESS.—What Edison Thinks; Hydraulic Air-Compressor Scheme; Frame Water Wheel, The Most Voluminous Patent, 426.
SCIENTIFIC PROGRESS.—Acetylene Gas; Power of the Brain; Myopes; The Atmosphere at High Altitudes; Wastes of Heat in Generating Steam, 427.
ELECTRICAL PROGRESS.—Improvements in Engine and Dynamo Building; Canal Electric Traction for Army Purposes; Can the Voltage of Incandescent Lamps Be Safely Raised? 428. Electricity in Powder Mills, 429.
PRACTICAL INFORMATION.—Brazing; Metalloids; British Steamers Loading Cargoes of Iron at Mediterranean Ports for Philadelphia; World's Columbian Exposition Medals and Diploma, 429.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 430-31.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 438.
MISCELLANEOUS.—Concentrates, 422. A Letter from Hon. Tirey L. Ford, 423. Notes on Gold Milling in California; Fire Assays, 424. The Small Invention; Copper Refining by Electricity, 425. Don't Worry the Eyes; Distance at Which the Human Voice Can Be Heard, 427. Railroad Statistics, 429. Coast Industrial Notes; Personal, 431. Notices of Recent Patents, 434. Index, 439-40.

Concentrates.

THE gravel miners are waiting for rain.

THE Mayflower gravel mine paid dividend No. 21, $6000, on the 20th.

THE Salt Lake, Utah, mining exchange was opened on the 26th inst.

IT is thought that there are over 14,000 working miners in this State.

UTAH will become the 45th State of the American Union next Saturday.

THE California Gold Mining Exchange has been established with twenty-two charter members.

SEC'Y SMITH decides that State surveyors-general may appoint non-resident deputy mineral surveyors.

MERCUR, UTAH, claim owners declare they will "bore a hole through the first man found molesting stakes."

IT is locally asserted that Capt. DeLamar will build another big mill at the Mercur, Utah, mine next spring.

THE Bald Eagle, Alaska, mine has netted its owners $75,000 this season. N. S. Trowbridge is superintendent.

APPLICATIONS for patent for mineral claims are at present more numerous in the columns of interior State papers than for several years past.

THE change in mining methods is illustrated by a statement in this paper in March, 1877, of smelter charges in Inyo Co., this State, aggregating $39 per ton.

AT the sale of the Young America mine, Sierra Co., the property was bid in by W. P. Veuve for $11,339.48. It will be reopened and actively worked next spring.

BROAD-GUAGE trains are now running directly into the town of Cripple Creek from Denver over the Santa Fe, Colorado Midland and the Midland Terminal railroads.

SOUTH AFRICAN PAPERS say that in five years' time 8000 stamps will be in operation in the Witwatersrand district. In '92 there were 1970 stamps running; at the beginning of this year 2642; there are now about 3500.

STATISTICS for '95 are not yet procurable, but State Mineralogist Crawford thinks that the gold yield of California for this year will exceed $15,000,000; for '94 the aggregate was $13,923,281.89; for '93, $12,422,811.60.

THE Julian Gold Mining Co., recently incorporated, will develop three ledges on the 120 acres recently acquired from L. Schilling, five miles from Julian, San Diego Co., Cal. The secretary writes that a stamp mill will shortly be erected.

PECK BROS. have completed their plant at the Mexican mill to extract the gold and silver in the tailings. They proposed to build a wire-rope tramway from the Morgan mill tailings back to the Mexican mill, where their plant is situated, and to reduce the Morgan mill tailings at the Mexican mill.

SUPT. T. J. DICKIE has finished the new mill at the Union-Companion mine, Cornucopia, Or. It has twenty 1000-lb stamps and will he operated hy electricity. A gravity system tramway will carry the ore from the mine to the mill, a quarter of a mile. It is expected to he the largest bullion producer in that country.

THE Lawrence Reduction Works at Lawrence, Cripple Creek, Col., were totally destroyed hy fire last Monday. About 2500 gallons of gold solution valued at $7000 were lost. There was $40,000 worth of orc in the hins awaiting treatment. The plant cost $100,000. The loss of supplies is $8000; insurance, $50,000.

WITH the opening of '96, the personnel of the U. S. Debris Commission in this city will he changed considerably. Col. Mendell, recently retired, is succeeded hy Col. Chas. R. Sutte. Lieut.-Col. H. H. Benyaurd goes to St. Augustine, Fla. Major W. H. Heuer is transferred to Cincinnati, O., and will he succeeded hy Maj. C. F. L. B. Davis, now on duty at Washington, B. C.

FROM Montana's higgest mining town comes the higgest and hest edition of any newspaper ever published in the region round about—the Butte *Miner*, grandly illustrated, 36 pages of solid facts concerning the mining industry of that thriving locality.

CONGRESSMAN SHAFROTH, of Colorado, has introduced a bill providing that all mining claims hereafter located shall be staked with stakes 100 feet apart, so as to clearly define the boundaries of all claims, and prevent, as far as possihle, the overlapping of claims. Shafroth says that the staking will be slightly more expensive, hut will save a great deal of trouble and law-suits in the future.

THE Committee on Mines and Mining in the House of Representatives in the 54th Congress is composed of D. D. Aitkin of Michigan, chairman; Hartman of Montana, Leisenring of Pennsylvania, Mondell of Wyoming, Crump of Michigan, Graff of Illinois, Eddy of Minnesota, Hardy of Indiana, Cannon of Utah, Tate of Georgia, Cockrell of Texas, Neill of Arkansas, Kendall of Kentucky.

NEW SOUTH WALES MINERS want a convention at Sydney "to consider the mining laws, to suggest any amendments therein, to make suggestions concerning the wants of the several mining centers, to suggest methods by which the mineral resources of the colony may he more effectually developed, to consider the advisableness of erecting batteries on some of the gold fields, and generally to suggest and consider questions which will tend to advance the mining interest."

D. COLLINS, an employe of the Independence mine at Victor, Colorado, met a terrible death last week. He had stepped on the cage and gave the signal to hoist him to the surface. After it had started, it is thought that he remembered he gave the wrong signal, as he wished to stop at one of the upper levels. Reaching over to catch the bell cord, he lost his balance and fell, his body catching between the cage and the timbering of the shaft. After the cage had passed upward, his body, which was crushed to a pulp, fell to the lower level.

CLAIM-JUMPING is reported from various localities. That procedure is not so easy nor so profitahle as it used to be. The burden of proof is upon the contestor. The land office is inclined to favor the claim-owner, provided he has shown, or is willing to show, a disposition to comply with the requirements of the assessment law. There is no recognized rule of measurement by which it can be definitely determined as to whether the owner has performed work which might have cost him $100, and those who expect to get rich by jumping claims are apt to meet with deserved disappointment.

BEING asked this question: "Suppose a prospector were to find a ledge of free-milling gold quartz, two surfaces of which were exposed for a distance of 150 feet each in width, for a distance of 1200 feet in length, like one edge of a box; suppose the whole surface would give an average assay of $10 per ton and the ledge had convenient water and wood facilities: how much ought it to sell for, undeveloped?" the Salt Lake *Tribune* conservatively replies that, probably it would pay the discoverer far better to do some development work on it than to offer it for sale; he may be sacrificing too good a thing.

IN Denver, recently, Governor Richards of Wyoming told how near he escaped heing a millionaire. "I visited San Francisco," said he, "at a time when there was quite a rage in stocks on the Comstock lode, and felt a touch of the fever. I saw that Ophir stock was down to rock hottom, and called upon a friend of mine who was a broker to ask his advice as to making an investment of $1000 in Ophir. I think the stock was quoted at 40 cents a share. The broker laughed at my faith in the stock, and insisted that I should return to Colorado without leaving any money in California. Six months after Ophir was selling at $750 a share."

THE annual report of the Globe Smelting and Refining Company of Denver shows a production of bullion in 1895 amounting to $4,541,713.91. Of this Utah contributed 328 ounces of gold, 305,269 ounces of silver and 2,626,715 pounds of lead; Montana, 275 ouuces of gold, 19,379 ounces of silver and 232,849 pounds of lead; Idaho, 2491 ounces of gold bullion, 439,872 ounces of silver, and 11,371,369 pounds of lead. The value of the Globe company's output was divided up among the metals as ollows: Gold, 58,115.1 ounces, at $20.67, $1,201,239.12; silver, 3,483,682.3 ounces, at 65.4c., $2,513,768.22; lead, 25,371,575 pounds, at 3.12c., $791,593.14; copper, 319,213 pounds, at 11c., $35,113.43. Total, $4,541,713.91.

A LIST has heen puhlished of companies formed to operate mines in British Columhia. The aggregate amount of their capitals is away up in the millions. This list is being copied in papers all over the country. This is unfortunate, because it is exceedingly misleading. Some of the companies it names scarcely had any existence at all except on their prospectuses, others have died since, while of those that remain only a small portion of the capital is paid up. It is a pity to publish such statements about a country; they only give it a "black eye." The Nelson, B. C., *Miner* notes with pleasure the suggestion of the Spokane *Chronicle* that the capital stock should represent the value of the investment.

AT last Monday's meeting the Dehris Commission issued permits to the owners of the Lost Camp mine, near Blue Canyon, Placer county; Forest Home mine, Amador county; W. H. Cole, near Grizzly Flat, El Dorado county; Pine Leaf mine, near Spanish Ranch, Plumas county; Ram Creek, near Brush Creek, Butte county; Irish Hill, near Oleta, Amador county. The following mining companies were authorized to build dams: Bull Neck, near Rancheria, Amador county; Mill Gulch, Amador county; Jay Bird, near Camptonville, Butte county; Wild Yankee, near Shady Run, Placer county; Meehan, near Aqueduct, Amador county; Trafton, near Yankee Jim's, Placer county.

H. A. LEE, Commissioner of Mines for the State of Colorado, has his whole force of inspectors at work in the Cripple Creek district. He says: "All the power vested in the Bureau of Mines is being used to promote legitimate mining and to discourage and expose wildcat mining corporations, that are always launched in times of great prosperity, such as the whole State is now enjoying. The official reports, which become a part of the puhlic records of the State, contain a cold statement of the facts, free from emhellishments of possibilities, from which can be determined whether a property should be classed as a mine, a prospect, or a 'wildcat' scheme. This information is official and for the protection of all who avail themselves of it."

REPRESENTATIVE MONDELL of Wyoming has introduced a hill providing for the manner of making application for a patent on mineral placer lands, where the same are located upon surveyed lands of the United States. The hill provides that any person, association, or association of persons, or their assigns, applying for a patent to any lands entered under the provisions of the revised statutes, where the same shall be upon surveyed lands of the United States, may obtain a patent hy filing in the proper land office an application therefor under oath, showing compliance with the statutes under which such entry was made, together with a description by legal subdivisions of the land sought to be patented. Notice of such application for a patent must be posted in a conspicuous place on the land embraced in the tract previous to filing the application for a patent, and the application shall be accompanied by the affidavit of at least two persons that such notice was posted. The Register of the Land Office must then publish the application at least once a week for at least sixty days in the newspaper nearest the claim. The claimant, at the time of filing the application, shall file with the Register an affidavit that at least $500 has been expended in improvements. If no adverse claims shall have been filed with the Register or Receiver of the proper land office at the expiration of sixty days' publication, the applicant shall be entitled to a patent upon payment of the legal price for such lands.

IN an article on the mineral industry of California, in the San Francisco *Call* of the 25th instant, the State Mineralogist estimates the number of mines operated and miners employed in twenty-three counties of this State in '95 as follows: Amador, mines operated, 110; miners employed, 700; Calaveras, mines operated, 245, miners employed, 1027; Contra Costa, mines operated, 4; miners employed, 113; Del Norte, mines operated, 40; miners employed, 93; Humholdt, mines operated, 37; miners employed, 272; Inyo, mines operated, 72; miners employed, 207; Lake, mines operated, 14; miners employed, 256; Lassen, mines operated, 7; miners employed, 50; Mariposa, mines operated, 117; miners employed, 542; Mendocino, mines operated, 14, miners employed, 15; Mono, mines operated, 26; miners employed, 142; Napa, mines operated, 24; miners employed, 356; Plumas, mines operated, 77; miners employed, 503; Sierra, mines operated, 56; miners employed, 600; San Benito, mines operated, 5; miners employed, 46; Sacramento, mines operated, 32; miners employed, 252; San Luis Obispo, mines operated, 12; miners employed, 102; Santa Barhara, mines operated, 11; miners employed, 77; Shasta mines operated, 99; miners employed, 833; Siskiyou, mines operated, 420; miners employed, 1771; Solano, mines operated, 13; miners employed, 72; Sonoma, mines operated, 31; miners employed, 306; Trinity, mines operated, 186, miners employed, 691; Tuolumne, mines 242; miners employed, 964; Ventura, mines operated, 12, miners employed, 60. To the list might he added Butte, mines operated, 61, miners employed, 475; El Dorado, mines operated, 74; miners employed, 545; Fresno mines operated, 40; miners employed, 275. Madera, mines operated, 21, miners employed, 178; Riverside, mines operated, 31; miners employed, 304; San Diego, mines operated, 52; miners employed, 418; San Bernardino, mines operated, 63; miners employed, 378; Yuba, mines operated, 37; miners employed, 320, making a total of 2285 mines operated and 12,943 miners employed.

IN the case of the Tyler vs. the Last Chance Judge Beatty, last week in the U. S. Circuit Court for Idaho, decided in favor of the latter company. The decision turned upon the question of priority, already decided by the higher courts in favor of the defendant, the matter having been reversed and remanded to that court for a new trial. The court holds that as to the Last Chance location the Tyler ledge cannot be followed downward farther than to the vertical plane through the located north side line of the Last Chance location, and that the defendant Last Chance Co. is, therefore, entitled to judgment against the plaintiff for the possession of the premises in dispute which lie hetween those planes which descend vertically from those two side lines of the Last Chance, which were located as its side lines. The larger portion of the decision is taken up with the discussion of a point similar to that which entered into the Amy-Silversmith case. In the latter case the Supreme Court decided that a claim in which the vein crossed both side lines had no extralateral rights. This point was raised by counsel for the Last Chance in the case just decided. The vein in the Tyler intersects one end line and one side line of the original location. As the Tyler claimed to hold the apex of the vein, and to be entitled to follow the ledge into and through the Last Chance ground, application of the Amy-Silversmith rule would shut it out, and counsel for the Last Chance maintained that if a claim had no extralateral rights when the vein crossed hoth side lines the same reasoning would exclude it from such rights if the vein intersected one end line and one side line, as in the case of the Tyler. On this point Judge Beatty holds against the contention of the Last Chance Co. He says: "The statute says the right to follow the ledge along its course underground shall he limited hy the planes passed through the two end lines, hut it is manifest that this rule cannot he followed when the apex of a ledge, before reaching the other end line, passes out of the side line, for it would give the locator more of the ledge underground than he has of apex. It would give him a portion of the ledge of which he does not hold the apex. To hold that his ledge shall be cut off hy the vertical plane of his side line is cutting off the right to follow it down which the law has given him. Instead of this, to establish at the point where the apex crosses the side line a vertical plane parallel to the plane of the side line cut by the apex, and allow him to follow the ledge on its dip between these two planes, is not violation of any provision of the statute, and gives the miner only those rights the statute intends he should have. The courts, hy the cases above cited, have so held, and it is now held that plaintiff can so follow its ledge as far as not in conflict with some prior right." Applying this rule to the Repuhlican Fraction, a small wedge-shaped piece of ground lying between the Last Chance and the Tyler, and belonging to the Last Chance people, Judge Beatty decides that the Tyler Co. can follow the ledge through that territory; this hecause the Tyler holds priority of location over the Repuhlican Fraction. The case was first tried in Boise, Idaho, in 1892, a verdict heing returned in favor of the Last Chance. At that trial a prior judgment secured hy the Last Chance against the Tyler, in which priority of location was decreed to be in the Last Chance, was admitted in evidence hy Judge Beatty. On this point he was overruled by the Court of Appeals. The case was tried again in 1893, resulting in a verdict in favor of the Tyler, which was confirmed hy the Court of Appeals. On a writ of certiorari the case was taken to the United States Supreme Court, where the Court of Appeals was overruled, Judge Beatty's original ruling in admitting the prior judgment heing indorsed. This decision remanded the case for new trial, with the above result.

A Letter From Hon. Tirey L. Ford.

To the Editor:—The editorial pages of your issue of the 21st inst. are given up almost exclusively to a comparison and discussion of the two proposed mineral land bills recently considered by the Executive Committee of the California Miners' Association, which proposed bills are set forth at length at pages 402 and 403 of the issue referred to. Your conclusion seems to be that the bill finally agreed upon by the Executive Committee is a complete surrender of the rights of the miners of this State; that it is "a travesty on justice;" that it would be better to "pass no bill at all than for the miners of California, in or out of convention, to stultify themselves by endorsing a piece of proposed legislation that defeats the very object it ostensibly is meant to secure."

Now, Mr. Editor, I do not question your sincerity, though I do suspect that you have been grossly misled as to the facts upon which you have based your conclusions; otherwise some very unusual results must follow. If the bill finally agreed upon be in fact a surrender of the rights of the miners, "a travesty on justice," as you say, then was President Neff most unfortunate in his selection of the members of the Executive Committe, for, upon such a basis, that committee must appear either as an aggregation of mental imbeciles or a band of conscienceless conspirators. Before, however, we proceed to condemn the action of men whose fidelity to the mining industry is attested by their long and faithful service in its behalf, it might be as well to see just what all this fuss is about.

The California Miners' Association, since its organization, has had three matters prominently before it for consideration, viz.: First, the rehabilitation of the hydraulic mining industry; Second, the revision of the mining laws relating to the manner of locating, holding and working mining ground, and the manner of determining disputes between agricultural and mineral claimants; and, Third, the segregation of the mineral lands within the railroad land grants of this State. These three matters are all of the utmost importance to the proper development of our mining industry, and the miners of California have looked to their association for the proper settlement of these questions.

Hydraulic mining received the first attention of the association, and both Congress and the State Legislature responded to our appeals. The State Legislature did all it could within the sphere of its limited jurisdiction, while Congress gave us an act that yet needs an appropriation to make it complete. That appropriation the miners are still clamoring for, and it is a part of our duty to heed their appeal in that regard. The matter of amending the mining laws so that contests as to the mineral or agricultural character of lands may be referred to the local courts in the respective counties wherein the disputed lands are situated, was also most forcibly urged upon the association.

While these matters were engaging the attention of the association and its committees, the mineral lands question, as related to the railroad land grants within this State, was brought to the attention of the association. The other two matters above referred to were at once dropped, or held in abeyance, rather, awaiting the settlement of the mineral land question. To the settlement of the latter question the association gave its entire attention. A special committee was appointed to attend to the matter, which committee was given plenary power and all the financial aid for which it asked. For a year prior to the annual meeting of the association last October this committee employed such means as it deemed proper to secure the segregation of the mineral lands from the railroad grants. It spent several thousand dollars in presentiug the matter to Congress, to the President and to the Interior Department. The chairman of the committee made a personal visit to Washington to lay the matter before the President. Finally an effort was made, by means of a written correspondence with Mr. W. H. Mills, to amicably adjust the matter with the railroad company. All this time the other matters above referred to were quietly sleeping and the miners were getting somewhat restless, in fact, quite restless. They couldn't understand why it was necessary to spend so much time on the mineral lands question to the exclusion of all other matters to which the association had directed its efforts.

Then came the annual meeting of October last. The then chairman of the Mineral Lands Committee publicly declined to longer serve in that capacity, and Mr. W. C. Ralston was appointed in his stead. The writer, against his own inclinations, but at the earnest solicitation of Mr. Neff, again accepted the chairmanship of the Committee on Legislation.

Congress was about to meet. It was of the highest importance that we should be ready with our measures at the earliest possible moment. The bills relating to hydraulic mining and the proposed changes in the mining laws had already been prepared by the Committee on Legislation and approved by the Association. It only needed a mineral lands bill to complete our preparations for an appeal to Congress. The writer, as chairman of the Legislative Committee, drafted a bill based on the Idaho-Montana Act, and presented the same to the Executive Committee for its approval. This bill became known as the "Committee Bill," and is the same bill published at page 402 of your issue of the 21st inst. Mr. Ralston moved that the bill thus presented be approved by the Executive Committee and forwarded to Congress for passage by that body. After considerable discussion, and before a vote was taken on Mr. Ralston's motion, Mr. Wright moved that the chairman of the Legislative Committee and the chairman of the Mineral Lands Committee be appointed a special committee to confer with the railroad authorities and ascertain their views with reference to the proposed legislation. The writer and Mr. Ralston thereupon, and in pursuance of the instructions contained in the above motion, communicated with Mr. Herrin, chief counsel of the Southern Pacific Company, submitted a copy of the "Committee Bill," and requested his endorsement thereof. Thereafter, through Mr. Singer, chief counsel for the Southern Pacific Land Department, the company submitted a bill as a substitute for the "Committee Bill." This bill was not acceptable to the special committee, and the writer thereupon drafted a bill which became the basis of subsequent consultations between the special committee and Mr. Singer. After some minor modifications, this bill was accepted by Mr. Singer on behalf of the railroad company. In communicating his acceptance of such bill, Mr. Singer stated that the company's officers did not deem any legislation upon the subject necessary; that the practical operation of the company's affairs, arising out of their land grants, had demonstrated the efficiency of the executive and judicial departments of our Government to properly and fairly consider all controversies arising therefrom. Mr. Singer concluded his letter as follows: "It is because the Association which you represent earnestly desires the passage of the proposed bill that the company's officers will withhold their opposition, and not because they desire the passage of that or any other bill upon the subject."

This bill was reported back to the Executive Committee by the special Committee on the 11th inst., at the most largely attended meeting the committee ever held, save at meetings held immediately upon the close of an annual session and before the members have departed for their homes. Twenty-four members of the Executive Committee were present and the proposed bill, which became known as the "substitute bill," was read at length, and then read and discussed section by section. Several amendments were added as the sections were under discussion, and it was near midnight before the committee adjourned. The following evening (the 12th) the committee met again, pursuant to adjournment, and voted, first, upon the "committee bill," which received but one affirmative vote, and, second, upon the "substitute bill," which received but one negative vote. Nineteen members were present when the final votes were taken, with President Neff in the chair.

Is the "substitute bill," thus approved by a practically unanimous vote of the committee, after mature deliberation and exhaustive discussion, a "travesty on justice" and a surrender of the rights of the miners of California?

PRESENT SYSTEM.

Under the present laws and regulations there is no method whereby large areas of land within the railroad grants may be examined and the mineral or non-mineral character thereof determined. This has been demonstrated by the futile efforts of the late Committee on Mineral Lands so to do. That committee, through its chairman, spent much time and money in filing and prosecuting protests covering large areas of land, but without avail. The protests thus filed were promptly declared insufficient under the present laws, and were accordingly dismissed. Under the laws and regulations as they now exist, the railroad companies, speaking now particularly with reference to the Central Pacific and the California and Oregon, have been accustomed to make selections from time to time, and to make applications for patents for the land thus selected. The miner had no knowledge as to when these selections and applications would be made prior to the publication of notice thereof, and the notice itself was wholly inadequate. Often the miner, living in the mountain regions, far removed from the populous centers, would never know of the company's application until the time for filing protests had already expired. Occasional individual protests were filed, but no general protests could be successfully maintained, as we have already seen. Furthermore, such protests as did reach a hearing in the land office threw upon the contestant the burden of proof and compelled him to establish affirmatively not alone the mineral character of the land, but that each forty-acre subdivision contained mineral in paying quantities. And all this the contestant (the miner) was compelled to do at his own expense. He must furnish his own proof, procure the attendance of his witnesses, and employ counsel to prosecute the protest, and pay for it all out of his own pocket.

PROPOSED SYSTEM.

The "substitute bill" changes all this. In order to settle the matter once and for all, so that the miner may know that when he goes onto a piece of land he will not be disturbed by any further inquiries as to its mineral or non-mineral character, it is proposed that a complete list of all unpatented railroad lands, described by legal subdivisions, shall be published for sixty days in each county wherein any railroad lands are situated, so that ample notice may be given as to what are and what are not railroad lands. The passage of the act will itself be additional notice of the proceedings to be taken. In fact, the necessary preparations may be begun at once, if deemed necessary, and with that end in view the chairman of the Committee on Mineral Lands has already been allowed a clerk to secure the information necessary to enable the committee to file the requisite protests. At the proper time will come the filing of protests, which, so far as the association is concerned, will be looked after by its Committee on Mineral Lands. Any person, however, may file a protest. These protests, whether filed on behalf of the association or by an individual, may be wholly upon belief, the protestant being required to do no more than to detail the facts upon which such belief is founded. Certainly a broader liberality could not be asked by any fair-minded man. Knowledge of minerals in paying quantities, or otherwise, is not required. The Committee on Mineral Lands, through its selected agent or agents, will simply state that such and such lands are believed to be valuable for the minerals therein contained, and then state the facts upon which such belief is founded. In this way it will be an easy matter for the Mineral Lands Committee to cover with protests all lands that are even probably mineral, and thus cause such lands to be examined and classified in accordance with the provisions of the proposed bill.

Upon the filing of the required protests, it is made compulsory upon the Secretary of the Interior to suspend the issuance of patents as to all lands covered by such protests. The proposed bill then provides, in express terms, that "no lands so suspended shall be patented to any railroad company until, if at all, after the non-mineral character thereof shall have been established by a preponderance of proof in the manner hereinafter provided."

Under the present system the burden is upon the contestant (the miner) to establish the *mineral* character of the land. Under the proposed bill the burden is on the railroad company to establish its *non-mineral* character. In other words, the mere filing of the protest will stamp the land protested with a mineral character, and the railroad company, in order to get a patent therefor, will have to "prove the mineral off," as the miners say, and this it must do by a "preponderance of proof."

The protests being filed, the rest is easy and simple. The Government furnishes three commissioners for each land district to examine the land protested, and to testify concerning the same. They are also to procure the attendance of other witnesses and to introduce any competent proof. Any person interested may also introduce evidence at the hearings. The President also appoints an attorney for each land district wherein hearings are ordered, who must be a resident of the district for which he is appointed and whose duty it shall be "to appear and maintain the mineral character of all the lands subject of the hearing."

In the matter of evidence in support of the mineral character of the protested lands, the door for its admission is opened as wide as the most radical mineral advocate has ever suggested. The exact language of the proposed bill in this regard is as follows:

"That at such hearings evidence may be introduced by any person interested to show that any of such lands have, *or probably will have*, a market value by reason of the minerals which they contain; or that they show such indications of deposits of valuable minerals as would induce a miner to spend his time or money upon them with the reasonable expectation of finding mineral in paying quantities; or that such lands, from their geological formation, or location in a well defined mineral belt, or their situation or propinquity or relation to known mineral lands, are, *or probably will be*, valuable for the minerals therein; and all these matters shall be considered in determining the mineral or non-mineral character of such lands, and in classifying the same."

It could scarcely be claimed that such evidence is calculated to work any serious hardship upon the miner.

To sum up, the proposed bill provides:

1. For the filing of general protests by any person whomsoever, concerning any lands known, *or believed*, to be mineral.

2. That the lands thus protested shall be deemed mineral, and the patenting thereof suspended until their character can be finally determined.

3. That, after the filing of the protests, all expenses attending the examination and classification of the protested land shall be borne by the general Government, including the employment of special counsel to defend the mineral character of the land.

4. That the burden of proof shall be upon the railroad company and not upon the contestant as at present.

The fact is, the "substitute bill" provides for an expeditious and equitable adjustment of the mineral lands controversy. It provides for the establishment of every right the miners have ever claimed in relation to the contested character of railroad lands, and provides that the work they have heretofore carried on at private expense and under burdeasome difficulties, shall be undertaken by the general Government, as it ought to be. The work of classification would be pushed to a speedy conclusion and the miner would then rest in the conscious security of the validity of his mineral title.

IDAHO-MONTANA ACT.

The "committee bill," which is based on the Idaho-Montana act, would, of course, accomplish precisely the same ultimate results. It is apparent, however, that the "substitute bill" provides a more expeditious method of procedure and would, moreover, entail less of labor and expense upon the association. Under the "committee bill" a commission would examine all the railroad land in the State, take testimony with reference thereto, and report its character to the local land office. The decision of the commission is only *prima facie*, however, and the land is still subject to protest, besides which the report of the commission is subject to review by the Secretary of the Interior, to whom all the testimony must be forwarded. The railroad company would be at liberty to protest against any report of the commission and thus compel the association to defend the mineral character of the protested land. In such event it is provided that the United States Attorney or his assistant shall represent the Government at the hearings in the local land offices, but any evidence the association might desire to introduce would have to be procured at private expense. Under either bill the ultimate determination of the mineral or non-mineral character of the land examined would rest with the officers of the Land Department.

PROTESTS UNDER SUBSTITUTE BILL.

Your most serious objection to the substitute bill seems to be directed to the requirement that the protests "must fully set forth in detail the facts upon which such knowledge or belief is founded"—that is, the knowledge or belief as to the mineral character of the land protested. This provision was the subject of careful consideration both by the special committee that reported the bill and by the Executive Committee to whom it was reported. While the section containing the above provision was under discussion in the Executive Committee, some one suggested that it might be well to modify the above-quoted language by striking out the words "in detail." No motion to that effect was made, however, but in response to such suggestion Mr. John McMurray of Trinity, a prominent mining man and former State Senator, very aptly said that if the miners could not state the reasons upon which their belief as to the mineral character of any particular tract of land was founded, they should not ask such land to be declared mineral.

WHY A PROTEST IS REQUIRED.

The objections made by Mr. Singer on behalf of the railroad company to the "committee bill" were: 1. That three commissioners were to be appointed for the entire State who were to be their own judges as to the time within which their labors were to be completed; and 2, That all the railroad lands in California were to be made the subject of examination, the larger portion of which were admittedly non-mineral. To obviate the first objection, provision was made for three commissioners in each land district. In answer to the second objection, the special committee informed Mr. Singer that they had no desire to make any lands the subject of examination other than such as might be reasonably believed to be mineral in character. Various methods were then proposed for limiting the inquiry to the class of lands suggested, and finally it was agreed that the miners should indicate, by means of protests, the lands they desired to have examined and classified; that such protests might be made upon belief only; but, in order to show the good faith of the miner, he must set forth his reasons for such belief.

Such is the origin of the provision in question, which, as can be readily seen, will tend to expedite the work by limiting the investigation to such lands as the miner may desire to have examined and classified.

It is not claimed that the "substitute bill" will produce any better or different results than would the "committee bill," either of which would be satisfactory to the miners. It is clear, however, that the work will be more expeditiously done under the "substitute bill" and with less labor and expense to the miners than under the "committee bill"; and expedition is deemed of much importance by all concerned for the reason that mineral titles within the limits of the railroad grants must remain more or less in an uncertain state until the entire matter is definitely determined.

Now, Mr. Editor, permit me to say in conclusion that this is too grave a matter to be lightly cast aside by mere assertions of disapproval. To say broadly, and without specific reasons therefor, that the "substitute bill" is a "travesty on justice," or that it will "defeat the very object sought to be accomplished," argues nothing, unless it be a lack of argument. The miners of this State are patient and law-abiding people, but they are intelligent as well, and they have made up their minds that it is about time this mineral lands question was finally disposed of. There are other matters affecting the mining industry concerning which the miners of California are most deeply concerned and in relation to which the association is expected to take some energetic action. The miners expect us to stop our apparent wrangling and proceed to business. In short, they want less dress parade and more active service. Our duty in the present instance is plain, and our fidelity to the miners' cause will be measured by the energy that characterizes our support of the legislation now so eagerly demanded in behalf of a re-awakening industry. Respectfully yours,

TIREY L. FORD,
Chairman Committee on Legislation, California Miners' Association.

Notes on Gold Milling in California.

NUMBER VII.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

In dressing the apron plates prior to starting the stamps, they are first washed down with the hose, to remove all particles of coarse sand which might otherwise scratch the plate during the subsequent dressing, then rubbed with a brush, using, if necessary, some fine tailings sand to remove all spots or stains. During this part of the operation the brush is moistened with different chemicals, according to the prefereuce of the millman; some use weak cyanide of potassium; others use strong brine, with a small addition of sulphuric acid; also sal ammoniac, or soda, or lye, besides other combinations. In many cases these prescriptions are carefully guarded by their possessors as trade secrets, and are considered the basis of all the success the owner has achieved in his business. Anything that will give the plate a clean surface, free from oxidation stains, and retain for the quicksilver its bright condition, is useful in this respect. The main point to achieve success is to always keep the amalgam on the plate bright, and of the right consistency, and this art can only be perfectly acquired by actual practice around the battery and plates. After the plate has been thoroughly cleaned, quicksilver is thinly sprinkled over the entire surface, through a cloth, and spread evenly by means of a brush or piece of blanket, and finally the surface gone over with a soft broom or brush, from side to side; this leaves the amalgam remaining on the plate with fine ridges parallel to the screen.

Among the plate devices used in California mills, which may take the place of the apron plates, or may follow them, is a late invention known as the Gold King Amalgamator. It consists of an iron cylinder, or drum, 6 feet long aud 12½ inches in diameter, divided lengthwise into two equal parts, hinged together, and capable of being locked. Fitting tight inside of the cylinder are two corresponding semi-cylindrical silver plates, each with two longitudinal ribs set radially, at one-third distance apart and about 3 inches deep. The upper end of the cylinder is furnished, around the circumference, with tooth-gearing, into which fits a spur wheel with a four-to-one transmission, driven by a 12-inch pulley. In the center of this end is a 3-inch feed opening, through which the pulp is dropped into the revolving cylinder. A trunnion at the lower end rests in a slide bearing, that permits of fixing the grade to he given the cylinder by means of set screws. The machine makes forty revolutions per minute, the pulp requiring about 3½ minutes to pass through the machine before being discharged. It is run by less than ½ H. P., and is easily set up. The pulp, when dropped into the closed cylinder, is caught by one of the ribs and raised to the highest point, when it drops, to be again taken up by the next rib, advancing at the same time a short distance ahead. The discharge is through the center at the lower end of the cylinder. From 15 to 20 tons can be passed through in a day; or, for a larger sized machine, from 25 to 40 tons.

Where concentrators are used in the mill, the sluice plates that follow the aprons are usually not over 8 feet in length and from 16 to 20 inches wide, with less grade than the apron. This latter point is reversed in some mills, and the sluice plates are comparatively steep.

Between the aprons and the sluice boxes a drop box is placed, into which the pulp from the aprons discharges; there is one to each apron, or one for two adjoining ones. These boxes are 1 foot wide and about 10 inches deep, with flat or partly sloping bottoms; these latter, generally where one box is used for two aprons, the bottoms sloping from each end across the width of the apron, toward a central part, where the bottom is level, and from whence it passes by overflow to the sluice plates. These sluice plates are in short lengths, and are either laid overlapping or screwed down to form a continuous sheet, and are prepared and treated in the same manner as the aprons. Of late years a useful addition is being made to the plates in the form of a shaking plate, of the same width as the aprons, and immediately below them. It is either suspended or on a movable frame, and is given an end or side-shaking motion and light grade; for an end shake the motion is imparted by a cam with ¾-inch stroke, and 200 strokes per minute. The correct strokes for these plates must be determined at each mill by experiment. Their efficiency was demonstrated in one mill, where the pulp passed over two successive apron plates, and then to the shaking plate, which accumulated a greater amount of amalgam than the second apron.

Amalgam Traps.—To retain any quicksilver or small particles of amalgam that escape inadvertently while dressing or cleaning the plates, traps are generally placed below the sluice plates, and are made of various patterns. The general idea is for the pulp to drop to the bottom of a deep vessel and flow out at or near the upper edge; in some cases passing over a series of inclined shelves or copper plates during the descent. A simple and very efficient contrivance for an amalgam trap is to suspend a narrow box by one end and attach the opposite end to a rod connected by a pin to an eccentric, through which it receives a gentle shaking motion in the direction of its long side. The tailings are introduced into a stationary box immediately above, from whence, diluted with fresh water, the pulp passes over the top of a partition in an even sheet to the suspended box below. The proper motion for this lower box must be found by experimentiug, for which purpose the end of the rod is supplied with a series of holes, to shorten or lengthen the stroke. The motion should be just sufficient to keep the pulp suspended like quicksand, without splashing or caking on the bottom.

Amalgamating.—Quicksilver is charged by hand into the mortars through the throat, at stated intervals, with a small wooden spoon. Automatic quicksilver feeders have been invented that are worked from the cam shaft in such a manner that, at stated intervals, a little cup on a ratchet wheel, in revolving, dips quicksilver from a reservoir and drops it through a tube into the mortar. This insures absolute regularity; but for some reason they do not find much application in California. Retorted or new quicksilver should be used for charging as well as for dressing the plates. It is a good plan to keep the quicksilver used for these purposes covered with a weak solution of cyanide of potassium.

Quantity of Quicksilver.—To form some idea of the amount of mercury necessary to be introduced when handling an ore, the value of which is not known, a horn spoon test of a weighed quantity is made, and the quantity of gold decided. Gold alloyed with an appreciable amount of silver requires a larger addition of quicksilver than does a purer gold. One ounce of gold of average fineness can be amalgamated with 1 ounce of quicksilver, but for a safety margin an allowance must be made, so that 2 ounces will answer better; and with extremely finely divided gold, 2½ or 3 ounces. If the stamps have a duty of 2 tons each, the amount of mercury requisite to amalgamate the gold contained in one ton of ore should be divided into five parts and introduced at half-hour intervals. If the ore be of low grade, the necessary portion may be added every hour; as the value increases, the stated intervals for charging should be reduced. The larger proportion of California gold ores receive mercury every half hour.

The skilled millman judges from the condition of his plates as to whether he is charging correctly. He places his finger on the apron plate, and if the accumulated amalgam gives to a gentle resistance, and has a putty-like feeling, the condition is about right; when hard to move, he must increase the charge; or, if thin, reduce it. The harder the amalgam, the more it assumes a dead-white color. The matter of correct charging of the mercury requires a constant watching, as on this depends the success of battery amalgamation; hence, the ore should be frequently tested with the horn spoon.

Amalgam retained on the inside battery plates weighs heavier, for the bulk, than the apron amalgam. There is a diversity of opiniou among millmen as to how often the amalgam accumulated on the aprons and sluices should be removed. Thus it is found in the California milling practices that aprons are scraped as often as twice a day in some mills, while in others it is allowed to accumulate from one clean-up day to the next, which sometimes means once a month. Personal experimeuts by the writer, conducted in various mills, invariably showed a yield of more amalgam from the more frequent removal of the accumulations, but as the clean-up of the apron would require the cessation of crushing, such frequent stoppages would materially lessen the output. To avoid this, as the upper 18 inches of the apron plate retains about 75 per cent of all the amalgam on it, this much of the apron plate may be made separate from the rest, and held in place by wooden buttons on the side, so that it can be removed at any time while the battery is at work, and an extra plate, provided for the purpose, slipped in its place. Once or twice in the twenty-four hours it is advisable to hang up the stamps, one battery at a time, and dress-over the surface of the apron plate, sprinkling, if necessary, a little fresh mercury, and brushing it into the adhering amalgam, after which the amalgam should be evenly spread out again. This takes but a very few minutes. Frequently, when dressing a plate, a very fine coating of brownish or grayish color can be seen adhering to the surface, which, on the application of the brush, is easily detached and thoughtlessly washed off. If this be examined under the glass it will be found to contain considerable gold, hence should be gathered carefully in the gold pan.

To remove the amalgam from the plates, the stamps are hung up, the battery water shut off, and the front of the screeu and plates hosed off to remove any sand which would scratch the plate. The surface of the plate is softened by the addition of quicksilver until the amalgam moves readily. Then, commencing at the bottom and working upward, with a piece of rubber, or rubber belting, 4 inches long, with square edges, the amalgam is pushed ahead to the upper end of the apron, gathered in a heap, and transferred to a pan or bowl by means of a scoop. The amalgam is taken to the clean-up room for further cleansing.

Where the amalgam has been retained on the plate for any length of time, as during an entire run, it requires a chisel or caseknife to remove it thoroughly, care being taken not to scratch the plate. In scraping a plate it is not advisable to remove ("skin") all the amalgam; enough should be left to form a thin coating, when ready to commence crushing again.

All mills experience more or less loss of quicksilver, partly through careless handling in dressing the plates, but also from the "flouring" of the mercury (breaking up into minute globules) after charging in the battery. This loss is extremely variable in the different mills, depending on the nature of the ore, high discharge, and low temperature of the battery water. Ores carrying much talc, black oxide of manganese, galena, or arsenical pyrites, cause a good deal of flouring of the mercury. A further cause of loss is through incomplete retorting, a certain amount of mercury being retained in the bullion, which is volatilized in the subsequent melting. One-half ounce to the ton of ore may be taken as near the average loss for California mills, although in a few cases these figures are doubled.

As the amalgam retained in the battery is less liable to loss than that portion adhering to the outside plates, the aim of the millman is to retain the largest proportion inside the screens. The coarseness of the gold has a good deal to do in this direction, as well as the splash and height of discharge. In some mills as high as 80 per cent of the total yield of amalgam will be found in the battery; it is always greatest with the same grade of gold, where the most copper plate surface is found inside the battery. The average proportions of amalgam retained in this country may be stated as two-thirds in the battery as against one-third on the (outside) plates, depending, of course, on the character of the gold in each district.

As the proper conditiou of the mercury is a matter of importance to the millman, it is well to become familiar with its different phases. Pure mercury is bright, quick, and does not change its appearance on exposure to the air at ordinary temperature, but evaporates slightly. As the temperature decreases it becomes stiffer, and at low temperature assumes a more leaden appearance; in raising the temperature it becomes more liquid. At 60° Fahr. it emits vapor sufficient to discolor a bright piece of gold when suspended over it in a closed vessel. Pure mercury, if dropped into a porcelain dish or on a table, will form into spherical globules, whereas the impure metal breaks into pear-shaped drops, and, if very impure, the particles drag a tail when moved. If containing lead, a skin of metal will remain on the finger nails when passing the hand through the surface. The introduction of grease or other unctious substances, like clay and talc, incline the metal to separate into extremely fine globules—flouring. Quicksilver is attacked by heated concentrated sulphuric acid, but is not affected by it when diluted. Muriatic acid likewise does not affect it. Nitric acid attacks it and forms nitrate of mercury, a white compound. Quicksilver that has been used in gold milling dissolves and retains a certain amount of gold, which remains with it, even after retorting. If quicksilver of this description be left for months undisturbed in a cold place and then carefully poured or siphoned off, a network of fine, needle-shaped crystals of amalgam will be found in the bottom of the vessel, derived from this gold held in solution.

(To be Continued.)

* Bulletin No. 6, California State Mining Bureau.

Fire Assays.

H. Van F. Furman, chief chemist at the Denver branch mint, writes as follows as to the general accuracy of the fire assay methods:

There is a popular impression among many miners and others that the fire assay (the usual method) for gold and silver gives results which are not only too low, but that the method frequently gives but a small proportion of the precious metal contents of our ores.

Every mining community, and especially Cripple Creek, at the present time is inundated with "process men," who claim that they, by their own particular pet process, can save far more than the assay value of the ore, "as the fire assay is no good." Practical chemists and metallurgists, of course, pay no attention to such statements, as the discussion is an old one, and the accuracy of the fire assay for gold and silver has been so frequently tested and demoustrated that a discussion at this time would seem futile. While there is some reason for the belief that the fire assay does not return the full precious metal contents of the ore, the truth remains that it gives results which, considered from a commercial standpoint, are most excellent, and so near the actual contents in these metals that the writer doubts if any greater degree of accuracy is attained in the valuation of commercial products than that which is the result of the present Colorado practice for the assay and valuation of ores.

Under the English system for the purchase of base

metals (copper and lead) the practice prevails of making an assay as the Cornish copper assay, which is supposed to represent the percentage of base metal which will be obtained in the actual smelting operation. Such a system does not prevail in the United States, and as regards the assay for the precious metals the results obtained are supposed to actually represent the amount of gold and silver in the ore, as nearly as possible by commercial methods, the inevitable losses in smelting being allowed for by proper deductions from the price paid for the ore.

While losses of the precious metals do occur in the fire assay, when the assay is properly conducted these losses are quite small and not nearly as great as many suppose. In a recent series of experiments conducted by the writer the total actual loss of silver in crucible assays was 2.58 per cent. This was the average of a large number of experiments on a variety of material, the charges being made up so as to represent nearly every variety of ore likely to be encountered. The loss of gold was but 0.3 per cent. In another series of experiments by the scorification method the silver loss was 2.54 per cent, and the gold loss was 0.6 per cent. These assays were all run in the ordinary manner such as would prevail in good commercial work. Recently the writer examined three samples of Cripple Creek ore, with the following results: By crucible assays—No. 1, 39.0 and 39.5 ounces gold per ton; No. 2, 9.0 ounces gold per ton; No. 3, 22.5 ounces gold per ton. By scorification assay—No. 1, 39.5 and 39.0 ounces gold per ton; No. 2, 9.0 and 8.8 ounces gold per ton; No. 3, 21.8 and 22.0 ounces gold per ton. Before making these assays the samples were divided, and half of each was sent to an eminent Eastern chemist, who determined the gold contents by chemical analysis, with the following results: No. 1, 39.0 ounces; No. 2, 8.8 ounces; No. 3, 22.0 ounces gold per ton.

As the chemical analysis should have given all the gold present, the results show that the fire assay may be relied upon. This ore was a high-grade telluride, which is popularly supposed to be about the most difficult ore to assay and obtain correct results by the fire methods. The slightly higher results obtained by the fire method will be readily understood by practical assayers.

The Small Invention.

The purchasers of the telephones made by a certain manufacturer in Chicago probably appreciate the purpose that influenced him to write: "Every conceivable method of accomplishing mechanically or electrically this or that result is covered by a patent or patents on devices to that end. A mechanic of ordinary intelligence after a week's time in an electrical manufactory suggests to his superior a better design than the one in use. He is told that his suggested method is patented. Surprised, he suggests another way, and learns that this way is also patented, and so on through every new suggestion. In the writer's factory at least five hundred suggestions of improvements in one way or another have been offered by the ordinary workmen, and found upon examination already subjected to the dignity of patent claims, usually by a professional patentee. Of course, this fact would indicate absence of the elements of invention, and that the patents were of little legal value if litigated:" in other words, all the improvements which he would like to give the dear public the benefit of they already enjoy. But he also says: "No less than ninety per cent of the patents issued on telephonic apparatus are for simple improvements in the art, and not entitled to the dignity of invention. There are not more than ten in one hundred of the patents that a good mechanic, familiar with the art of telephony, could not have devised. It is quite easy to believe that of these ten about two-thirds are simple adaptations of old devices to the new art. Of the balance, about one-half are not patented in the name of the real inventor, and, if the two per cent remaining are, it is safe to assume that no considerable financial reward accrues to the inventor in more than one case out of two. This assumption resolves itself into a statement that only one invention in one hundred brings financial success to the real inventor. Searching this we find matter for serious thought. If ninety per cent of the patents are not real inventions, then that percentage of legal harriers stands in the way of progress in the art. Innumerable device patents are bought up by large concerns, or obtained at their instance, at a small outlay, and these patents are used to monopolize one or another branch of the art."

Surely there is an old familiar sound to that criticism, and memory goeth back to the days when Columbus stood the egg on the table and silenced his envious critics. Such criticisms are very tiresome. It would seem that a man intrusted with the management of a manufacturing plant ought to be able to perceive that there is no way of sifting out from the few real inventions those applications which he would consider too insignificant for patent: because it is manifest that the measure or standard must be independent of the whim of him who applies it.

The statute still authorizes the Commissioner of Patents to reject if, "in his opinion," the thing is "not of sufficient importance," etc. The Supreme Court, however, long ago settled that question by deciding that want of novelty is the only justification for rejection, and no application has been rejected upon any other ground, for more than a generation, with the sole exception of applications for perpetual motions or matters clearly immoral. Probably he has never reflected on the subject deeply enough to discover the difficulty if not the impossibility of formulating any better rule than the one in use for the past half century. Under the authority given by the letter of the statute the great inventions of the age would not have been patented. Morse, Howe, McCormick, Edison and Bell would have been rejected for the reason that the telegraph, sewing machine, reaper, phonograph, or telephone had no believers among the public when they were first proposed; and this list might be indefinitely prolonged. In fact, as this loose critic may easily see, every invention which is presented at the Patent Office is supposed to represent something about which neither the people nor the examiner ever before heard. In more than half the cases this proves to be true. Now, would the critic care to assert such infallibility for his judgment that he would undertake the selection of the good from the poor electrical contrivances which may be brought out in the year, by simple inspection and without opportunity for thorough test? If he would be willing to trust himself, I doubt if his fellowmen would share in his confidence. When an invention is presented at the Patent Office the examiner may or may not appreciate it. The chances are that he cannot, and in either case it would be cruel to submit the rights and interests of the originators of new things to the fallible judgment of any man or set of men. But when it is submitted to the test of novelty the case is changed. The officer can then dismiss his individual opinions and simply search for the same thing among prior inventions. That he can be impartial about.

Possibly the critic is right in stating that "Ninety per cent of the improvements on telephonic apparatus are for simple improvements in the art." I can very well remember the time when there were no telephones, and I am pretty well assured that from the crude and worthless instrument exhibited by Bell in 1876 to the instrument of to-day, which we all know is very far from being perfect, the advance has been by a multitude of small steps, none of which this critic may consider worthy of a patent. Yet no one will deny the importance of the aggregate, while it would be pretty difficult to decide which single one could be admitted. He may be correct in saying that any good mechanic might have devised either one of these things as well as the men who did devise them. Still as one did and the other didn't think to do so, there is a manifest difference in the thought, which is the essence of the invention. Here is where men of his way of thinking meet shipwreck. They ignore the fact that the invention resides in the perception that an improvement is possible, and the thought how it may be accomplished. They look at the wood or iron of the implement and say: "Pooh! anybody could do that." Perhaps he could if he had only *thought* of it. All inventions adapt old things to new uses, and it makes little difference how small or how large is the change which "adapts the old device to the new art," so long as the adaptation is useful and the public gets the benefit of it. This critic also loses sight of the fact that benefit to the public is the root of the patent agreement. The profit of inventor or manufacturer does not enter into the matter to the slightest degree. The only question is as to novelty, utility to the public after the expiration of the patent being assumed and conceded.

His classification of inventors and conclusion that a large percentage are fraudulent, and that not more than one per cent brings any financial reward, is extravagant and wild. When Mr. Thatcher was Commissioner of Patents he made an extensive inquiry and concluded that more than one-half of all the patents issued were financially remunerative. From my own knowledge I am satisfied that a far larger proportion than that are remunerative, and I think my experience justifies me in saying that the percentage of fraudulent applications is very small. I know many concerns who employ professional inventors, but the idea of employing professional patentees (perjurers) is a new one to me, and I cannot comprehend the motives which would lead a proprietor to thus put himself in the hands of a rascal.

That there is rascality connected with patents need not be denied. It would be hard to find any field of human endeavor where rascality does not get in. But the inducements to commit perjury for the purpose of cutting somebody out of an invention the value of which is always problematical are generally pretty small.

I think that it is a great mistake to belittle small inventions. The changed location of a pin which converts failure into success is not a small matter. Neither was the wooden ball and rubber string which so interested the people that they rewarded the inventor with an independent fortune. Things in this line are to be judged by the results they produce, and not by their magnitude in the eyes of a would-be critic of limited experience.—Electrical Engineering.

Copper Refining by Electricity.

By H. C. Carneau.

Copper as received at the refining works is in a comparatively pure state: it is in plate bars 1.5x 1x.5 feet, weighing about 125 lbs., and is placed in furnaces and heated to a bright redness. When they have reached the desired temperature, they are rolled in return rollers (generally of five sizes) until the plates are about twenty-three feet long, one inch thick and one foot wide. As this strip of metal goes out of the last roll, it is passed through a trough of cold water to cool it quickly and prevent formation of oxide. These strips are then cut into small plates about a foot and one-half long and one foot wide; the rough edges are also cut off, and when sufficient scrap accumulates, it is reheated and rerolled.

Two of these small plates are put in suitable, grooved, wooden racks, which may be used over again, two or three times.

These racks, when filled, are brought to the electrical depositing room, containing vats in series, each vat having a capacity of fifteen to twenty plate racks. There are generally twenty vats to a series, but the number varies. These vats are filled with a solution of medium strength of blue vitrol, sulphate of copper, which acts as a carrier for the copper in process of deposition. The copper sulphate solution is constantly kept moving and renewed by hydraulic pumps at the end of each series of vats and by means of a system of pipes and gutter.

The racks are now placed in these vats and electric wires attached. The current from the adjoining dynamo room is turned on and the copper begins to deposit from the positive to the negative side, or *vice versa*, according to the direction of the current. This deposition is allowed to go on, unwatched, for a period of fourteen days, at the end of which time the copper plates have completely redeposited themselves and the copper is almost pure. While the deposition is going on the impurities, as gold, silver, sulphur, dirt and a little copper, etc., fall to the bottom and form an important by-product.

The copper sulphate solution is now drawn off from the vats, and the plates are washed with a strong shower of water to wash off any slime that may have adhered to them. The plates are then removed from the racks and are brought to the furnace room. Here the copper is melted and any remaining impurities removed by obtaining the right temperature and pitch (*i. e.*, the right amount of oxygen), the arrival at which point the experienced eye of the operator notes.

The copper is then cast into ingots and bars, which, when sufficiently cool to form a homogeneous solid, are dumped into troughs of cold water to cool them quickly and thus prevent the formation of any oxide.

The ingots weigh from fourteen to sixteen pounds and are used for making brass, bronze and other commercial articles. The bars weigh much more than the ingots, generally about 135 lbs.

Treatment of the Slime.—In copper containing gold and silver, the treatment of the slime is one of the most important parts of the refining. The recovery of the gold and silver pays for the running of a refinery and the copper represents the profit.

The slime is first scraped from the bottom of the vats and put into slime barrels, in which it is taken to the slime house, a building generally of three or four stories.

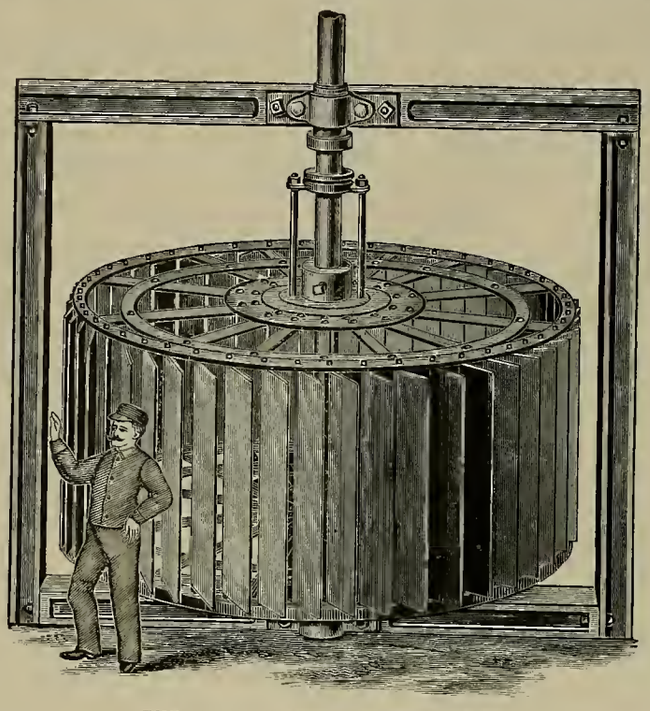
The slime is first made of a thin, mud-like consistency. It is then run into a swiftly revolving centrifugal, which has inside a forty-mesh sieve. This sieve allows all the gold and silver, some dirt and a little finely divided copper to pass through, while it retains the wooden chips, most of the dirt and copper. That which is retained is rejected, while that which passes through is run into a vat, where it is boiled by steam with a five per cent solution of oil of vitriol, until all the copper is dissolved as copper sulphate, the solution of the vitrol being too weak to dissolve any silver as silver sulphate. This, with the gold, settles to the bottom in its elementary state. The mass is then filtered on coarse cloth or canvas filters and washed two or three times to free of copper sulphate and dirt. The residual silver and gold are cast into bars, which, however, contain copper and other impurities. These bars are then dissolved in sulphuric acid, the silver going into solution as silver sulphate; the gold unacted upon by acid, falls to the bottom of the vat in a finely divided state. It is then gathered up, filtered and washed free of silver sulphate, etc.; it is then dried on pans, and when sufficient has accumulated, is cast into bars.

The silver is recovered by putting into the solution bars of copper. The copper being more electropositive than the silver, supplants it in the solution of the sulphate, and the free silver deposits on the copper bars. This reaction is allowed to go on until all the silver is deposited or until the solution gives no white precipitate (silver chloride) with a drop of hydrochloric acid. The free silver is then filtered and washed free of copper sulphate. It is finally dried on pans and cast into convenient bars.

Mechanical Progress.

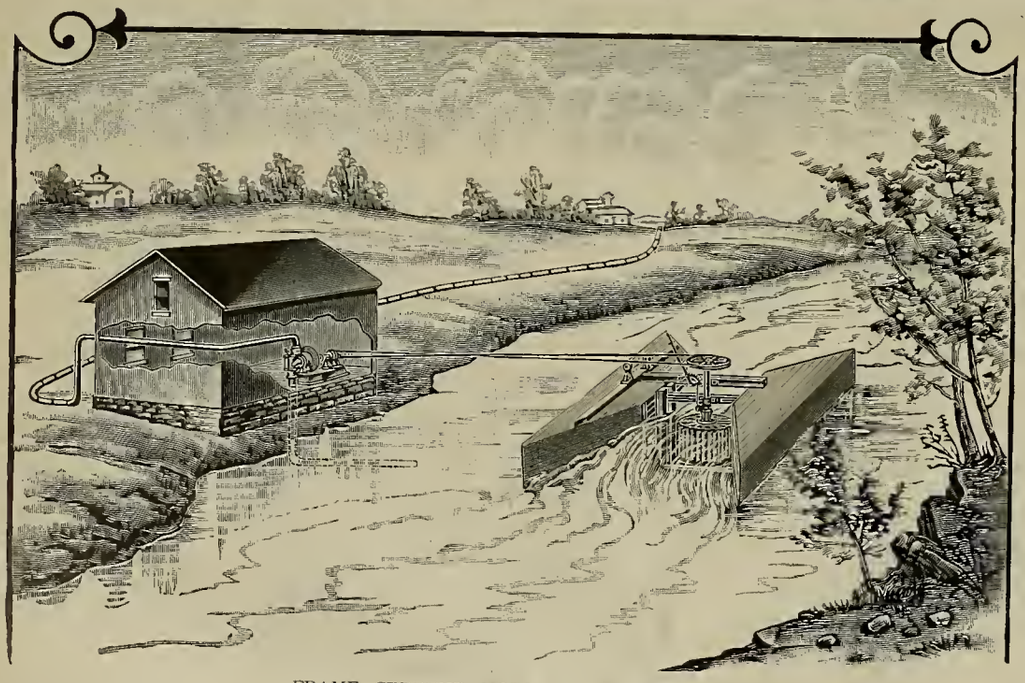
What Edison Thinks.

Talking of horseless carriages, T. A. Edison thinks that the horse is doomed, yet this animal shows a greater economy of force than man, 70 per cent of the energy of the horse being available for work. "But the horseless vehicle is the coming wonder. The bicycle, which ten years ago was a curiosity, is now a necessity. It is found everywhere. Ten years from now you will be able to buy a horseless vehicle for what you would have to pay to-day for a wagon and a pair of horses. The money spent for the keeping of the horses will be saved, and the danger to life will be much reduced."



"Will these vehicles be run by electricity?"

"I don't think so," said Mr. Edison. "As it looks at present, it would seem more likely that they will be run by a gasoline or naphtha motor of some kind. It is quite possible, however, that an electrical storage battery will be discovered which will prove more economical, but at present the gasoline or naphtha motor looks more promising. It is only a question of a short time when the carriages and trucks of every large city will be run with motors. The expense of keeping and feeding horses in a city is very great, and all this will be done away with, just as the cable and trolley cars have dispensed with horses. Every invention of this kind which is made adds to the general wealth by introducing a system of greater economy of force. A great invention which facilitates commerce enriches a country just as much as the discovery of vast hoards of gold."



Frame Water Wheel.

A new wheel is shortly to be placed on the Columbia river, in Oregon, for irrigation purposes, which involves an idea that the inventor thiuks will prove of value. On the proposition that a dam in no wise increases the power or efficiency in a stream of water, and that if a wheel could be built whose blade surface would be exposed to the force of the water in its banks, it would bring into immediate use the power of a navigable stream, the inventor, A. B. Frame, of Boyden, Iowa, has built a wheel, protected against damage by ice and drift iu its construction, and which is meant to combine the priuciples of a turbine water wheel and a wind mill. Herewith is illustrated the wheel, and also as it is to appear in operation on the Columbia river, where the inventor says it will furuish power to elevate 20,000 gallons of water per minute a height of 30 feet. It is built of steel throughout, works submerged in the current, is not affected by the rise and fall of water, and is controlled by an automatic governor.

The plan shown herewith is driven by the current motor, using a centrifugal pump. The rotary motion of the wheel is carried directly to the pump by means of wire-rope transmission. Other styles of connection can be adopted, and reciprocating or plunger pumps, connected by cranks and gears if advisable.

THE A. B. FRAME WATER WHEEL.

FRAME CURRENT MOTOR IN OPERATION.

Hydraulic Air-Compressor Scheme.

The Buffalo, N. Y., *Express* states that C. H. Taylor of that city has invented a hydraulic air-compressing system whereby power can be developed at much less cost than by turbines. The air is compressed by the direct action of falling water, without the aid of any moving machinery. The water is conveyed to a compressor by an open flume or through a pipe supplying a tank or stand-pipe around the headpiece of the compressor, where it can attain the same level as the water in the dam or source of supply. There are a number of small, horizontal air-pipes around the headpiece. These draw their supply of air through larger vertical pipes, which extend above the surface of the water and open to the atmosphere. As the water enters this down-flow pipe and passes the ends of small air-pipes, it draws in the air constantly, in the form of small uniform globules, which become entangled in the descending water, are carried down to an air chamber at the bottom of the pipe, compressing the air by weight of the water compressing the globules, according to their depth, below the tail-race water level, until they reach the point of separation. The air chamber at the bottom is sufficiently large to allow the air to rise to the surface of the water therein.

THE most voluminous patent ever awarded was sent out from the patent office iu October, '95. This patent was granted to James W. Paige, of Hartford, Conn., for a machine for distributing, setting and justifying type. It took 163 steets, containing 491 drawings, and 55 sheets of long primer to describe this patent.

Scientific Progress.

Acetylene Gas.

In San Francisco, as elsewhere, considerable commercial interest is manifested in the new acetylene gas. If half what is claimed for it proves so, it will work an industrial revolution. It was first heralded as destined to revolutionize the gas industry, but it is alleged that lighting is but one of the practical uses to which the product of carbide of calcium can be put. A New York concern—the Electro-Gas Co.—selling city rights at figures that would make a franchise for San Francisco worth about $250,000. This is for lighting, alone.

The Smithsonian Institution has paid its accidental discovers $10,000 as being the most important scientific discovery of the year, which it undoubtedly is. Heating a mixture of coal and lime, or charcoal and chalk, in an electric furnace and throwing the resulting compound into water evolves acetylene. One set of scientists claim that it is nothing more than an interesting laboratory experiment; others claim that it is of the utmost practical value.

It is claimed that "acetylene, ou being passed through an iron tube heated to dull redness, turns rapidly and completely into benzine. This is a product of prime importance, and is the base of thousands of organic substances. In illustration of the transmutations which can be effected, it may be pointed out that if the resultant benzine vapor be passed into strong nitric acid it is transformed into uitrobenzine, and this on treatment with hydrochloric acid and iron filings goes into aniline. With the formation of aniline the road is opened for the production of the immense series of dye substances of which aniline is the starting point. Instead of transforming acetylene into aniline, however, it may be changed into carbolic acid; thence it is but a step to picric acid, the foundation of the modern high explosives. Or it may be made into aniline, and then boiled with acetic acid, when it is transformed into anti-febrin, the well known fever specific. Again, by passing it through a tube heated to bright redness, naphthalene is produced, which is also the starting point for a legion of valuable chemicals. It would seem as though almost all the needs of man were able to be satisfied by this protean substance. The further investigation is pushed into its possibilities, the more astounding and bewildering they become. By the action of nascent hydrogen acetylene becomes ethylene, and this, on treatment with sulphuric acid and water, becomes alcohol, which, apart from its other uses, is absolutely necessary to the production of an enormous number of economic substances. In similar ways we can get such deadly poisons as oxalic acid and prussic acid, while acetylene is a cheap source of the aldehyde so much used in the production of artificial essences and the manufacture of mirrors. When, therefore, it is considered that from acetylene can be derived whole systems of dyes, medicines, essences, perfumes, poisons, explosives—not to mention cheap whisky—it will be seen that the latest product of the electric furnace has a utility out of all proportion greater than that which can be derived from its peculiar light-giving powers."

Going back to its utility as a light-producing power, photometrical tests have shown that for the production of a light of one normal candle power 0.6 litre of acetylene is required per hour if proper burners are used, while for the same lighting power 10 to 12 litres of coal gas used in ordinary burners are consumed. Acetylene, however, possesses different qualities, which are of a rather dangerous nature and have to be considered with caution. First, by its action upon copper or copper alloys a brownish substance is formed which is highly explosive; such metals, therefore, ought to be used neither inside the conduits nor for glow bodies, if acetylene, is employed as a lighting material. Iron is of neutral conduct towards acetyline. Second, a mixture.

of acetylene and air is explosive, the highest exploding power being reached in a mixture of one part of acetylene and 12 parts of air. Third, as all carbureted hydrogen gases, acetylene is very poisonous also. Happily, acetylene makes itself noticed quickly even in a very small quantity by its bad smell, whereby the dangers arising from leaks are restricted to a certain degree. Finally, it may be noted that acetylene can be formed during the storage and transport of calcium-carbide, also as soon as the latter comes into contact with water or absorbs hydrogen from the air. Sufficient measures of precaution are required, therefore, if acetyleue is to be adopted on an extensive scale.

Wastes of Heat in Generating Steam.

"Some Preventable Wastes of Heat in the Generatiou and Use of Steam," was the subject of a lecture recently delivered before the Franklin Institute, by William Kent, M. E., as reported in the *Journal of the Franklin Institute*. He stated that waste begins not unfrequently in the coal pile itself, or in its handling, its pulverizing or exposure to weather. In the furnace it is more largely wasted through bad styles of furnace or improper methods of firing. In the improper burning of coal a cause is found for a large amount of waste. In using anthracite the bed of coal may be too deep for the amount of draught obtainable, or too little draught for the amount of coal on the bed. In both cases there is imperfect combustion, obtaining from it only 4400 heat units per pound instead of 14,500. This is an easily preventable waste, this condition not obtaining to any extent if the relations of thickness of bed and of draught are such as to make the fire very hot and bright.

Another cause of waste is given as resulting from too much draught for the thickness of bed, or too thin a bed for the amount of draught. Thus imperfect combustion may be consequent either to a deficiency or an oversupply of air. In burning bituminous coal the escape of volatile combustible gases via the chimney robs the furnace of considerable heat. This is not easily preventable under present conditions of boiler practice, though it could be made so by proper appliances. It is necessary that the gas should be heated, also the air used to burn it, that combustion be carried on in intensely hot chambers and sufficient time be given for the gases and air to intermingle before escaping. A properly built oven with air-heating flues is stated by Mr. Kent as meeting these conditions.

Another cause of waste is located in the boiler. An insufficient extent of heating surface allows the gas, even if properly burned in the furnace, to pass into the chimney too hot. On the other hand, where a sufficient extent of heating surface is found, the surface may be so placed as not to be efficient; and the gases being short-circuited, may escape into the chimney without passing uniformly over the heating surface.

In the unclean condition of a boiler, inside or outside, or both, another cause for waste is found. Scale and soot are non-conductors of heat. Other wastes in the boiler are named, such as too small a grate surface, escape of steam through the safety valve, leaks of air in the setting of the boiler, and leaks of water into the furnace or flues.

The chimney also is often a sinner in the matter of waste. Much of this waste could be saved by the use of an economizer, or set of tubes placed in the chimney, through which the feed water is passed, and heated from the entering temperature to nearly or quite that of the boiler.

Another cause of waste is to be found in uncovered steam pipes. Sometimes these are too small and elbows too numerous. In the proper covering of pipes 90 per cent of waste is prevented.

In the steam engine itself wastes are numerous. In the following table we have the range of wastes, showing what may be expected to be the water consumed per horse-power per ton in different types of engines:

	Pounds and upwards.
Common direct-acting pump	100
Old style slow-speed throttling engine, non-condensing	45
Modern high-speed automatic cut-off	30
Compound " " "	22
Corliss single cylinder high-pressure	22
" " " condensing	18
" compound high	14
" triple-expansion condensing	12½

In concluding his lecture Mr. Kent says:

There does not seem to be any possibility of greatly reducing the waste in the steam engine; so that its consumption will be less than 12½ pounds per hour. In all steam engines we must throw away either hot steam, as in high-pressure engines, or a vast volume of hot water, as in non-condensing engines; and in the latter case there is no known way of recovering the heat from the water that we do throw away, so as to use it again in the engine. It may be left for the next century to discover some way of obtaining mechanical energy from coal without the intervention of the steam engine, but at present there seems to be no prospect of such an invention. The preventable wastes, however, are those enormous wastes which are indicated by the difference between a consumption of 12½ pounds per hour per horse-power, and the 25, 35, or even 100 pounds which are used in the various types of engines, and the still more inexcusable wastes which are indicated by the difference in the figures showing the best practice and the worst in steam boilers.

Myopes.

Dr. G. Sterling Ryerson, professor of ophthalmology in Trinity Medical College, Toronto, says:

Myopia being essentially a condition due to abuse of the eye, one is constantly obliged to say "don't" to patients. It occurs to me that it might be useful to put these prohibitory rules in aphoristic form:

1. Don't read in railway trains or in vehicles in motion.
2. Don't read lying down or in a constrained position.
3. Don't read by firelight, moonlight or twilight.
4. Don't read by a flickering gaslight or candlelight.
5. Don't read books printed on thin paper.
6. Don't read books which have no space between the lines.
7. Don't read for more than fifty minutes without stopping, whether the eyes are tired or not.
8. Don't hold the reading close to the eyes.
9. Don't study at night, but in the morning when you are fresh.
10. Don't select your own glasses at the outset.

It would almost seem as though some of these rules were too obvious to require mention; but practical experience shows that myopes abuse their eyes just in the ways stated. Reading by firelight or by moonlight are favorite sins. Reading lying down tends to increase the strain on the accommodation; and while traveling, tires the ciliary muscle because of the too frequent adjustment of focus. In short, anything which tends to increase the quantity of blood in the organ favors the increase of the defect, leading in extreme cases to detachment of the retina and blindness.—The Canada Lancet.

Power of the Brain.

The brain of mankind has been defined as a kind of phonographic cylinder, which retains impressions made upon it through the medium of the senses, particularly through the eyes and ears, says the *Family Doctor*. If this be true, memory must depend for its intensity and retentive qualities upon the degree of observation with which the record is made.

Nor is this all. If memory's record is kept in the shape of indentations upon the folds of brain matter, are they ever entirely effaced? In other words, do we ever really forget anything? May it not be that in the depths of the brain, memory has stored up a collection of things which are never again purposely turned to perhaps, but which instantly springs into being and flash through the mind whenever we hear or see something which recalls them?

There are several well-known mental phenomena which strengthen this theory. We know that memory often brightens during the last moments of life, and there are cases on record where Germans, French, Spaniards and others who, falling ill in this country years after having entirely forgotten their native languages, recovered and used them upon their deathbeds.

There is a theory that in all such cases the brain folds have relaxed, just as do the muscles and cords of the limbs and body, and that by so doing they expose to the mind's monitor indentations (recollections) which were long since folded up and put away as material that could not be of any particular use.

The balloon sent up in Berlin with self-registering instruments to investigate the atmosphere at high altitudes came down with the instruments in good condition in Bosnia. The balloon had reached an elevation of 53,872 feet (over ten miles). The thermometer had made desperate attempts to tell how cold it was ten miles above the earth, but failed. It did the best it could, but its limit was 52°. Another balloon is supposed to have reached an elevation of 72,000 feet (over thirteen and one-half miles) above the earth. Beyond recording these bald facts, the instruments seem to have given up their records in despair.

Don't Worry the Eyes.

The eye is a very sensitive organ, but it will stand a great deal, if you will not nag or overwork it. It is so much in evidence, and so constantly in use, that it is natural for people to be nervous if there is the least thing the matter with it, and to go to tinkering with it as if it were some piece of metal machinery instead of flesh and muscle.

If some little soreness appears, we are not satisfied until we have deluged it with "eye water." This as often brings on inflammation as it keeps it away; it may be that all the eye needs is a little rest.

A great many people use spectacles many years before there is any need of it. Instead of giving their eyes a rest, they keep them at work, with the aid and encouragement of glasses, sometimes ill fitted and really injurious.

"Everywhere" has in mind an old gentleman who at the age of sixty thought that his eyesight was failing, and wished very much to get some "glasses." But he lived at a distance from the place where good glasses were sold, and had to go without them, at least for several months. This necessitated a complete rest for the eyes, so far as reading was concerned; and they soon appreciated and took advantage of it. At the end of a few months he found, to his surprise, that his eyesight was becoming better again. Day by day it improved, and he finally found that it was as good as he had ever known it. He began to read again with new zest and vigor, being careful not to overdo the matter. He soon decided that he had no use for spectacles, and continued to the end of his life without them. He died over eighty years of age, with his eyes as "young" as ever.

So, when the eyes "give out," let us, if we are situated so that we possibly can, give them a chance to see what they can do for themselves, and maybe they will come out all the stronger and better for the chance.

EIGHTEEN MILES is the longest distance on record at which a man's voice has been heard. This occurred in the Grand Canyon of the Colorado, where one man shouted the name of Bob at one end, his voice being plainly heard at the other end, which is eighteen miles away.

OXIDE OF MANGANESE is reported discovered near Wallsbury, Wahsatch Co., Utah, similar in general appearance and value to the manganese mined in San Joaquin Co., this State, and worth from $20 to $35 per ton.

WITH so many highly-developed industries to choose from, the fact that such large attention is given to gold mining by both capital and labor is the best evidence of how the mining industry is considered as a business investment in these sunset years of the century.

DR. I. B. STORCH of Fruitvale sends an excellent specimen of pumice stone, croppings of a large deposit in Esmeralda Co., Nevada. Considerable has recently been written regarding a deposit of that material located near Salt Lake, Utah. It is found in Shasta and Sonoma counties and other parts of this State, and is of some commercial value, being used in the manufacture of soap, paint, burnishing metals, etc. T. B. Meyers of Sonoma says the supply there exceeds the local demand.

AN Alameda county correspondent asserts that the addition of a certain percentage of nitropbenole, or nitrobenzole, especially "nitropbenole sulphuret of soda," to the solution of cyanide potassium accelerates the extraction of gold and silver considerably. This important discovery was made at the chemical works of Mr. Schering, in Berlin, and experiments proved that two small gold foils, 1.5 grains each, were exposed for two hours to the action of the respective solutions; the cyanide solution, unmixed, absorbed only 2 per cent, while by addition of the nitrophenole sulphuret of soda 88 per cent of the gold was absorbed.

ON page 426 is a notice of the new gas acetylene. Considerable is claimed for it, but it is believed the most sanguine of these beliefs will never be realized. This belief is held in the old world as well as in the new. The *Journal fur Gasbeleuchtung* "has recently devoted a portion of two issues to an analysis of the cost of acetylene, by A. von Ibering, Aix-la-Chapelle. As to the cost of acetylene power, the conclusion is reached, basing calculations upon the price and quality of calcium carbide as furnished by the Neuhausen Company, that it would at least amount to 8½d per indicated horse power per hour. As gas engines ordinarily develop a like power from gas at 4s, say for ¾d, it is plain that there is no chance at present of competition from acetylene."

ONE noticeable phase of the cheap manufactures of Japan, now threatening the industrial life of this coast, is the additional leverage secured by disregard of ordinary business laws. In a piratical way the Japanese artisan pays no attention to the fact that a particular piece of mechanism is patented. He takes it apart and reproduces it without the slightest regard to the patentee's rights. Were an American artisan to attempt such a theft the law would speedily enjoin him, but in Japan the inventor is powerless. This is simply one feature of the kind of competition to which this country is subjected. It is not "a local issue." It affects alike the manufacturing interests of the entire nation. There is but one remedy, legislation embracing, in general, remonetization of silver and protection.

Electrical Progress.

Improvements in Engine and Dynamo Building.

Builders of automatic engines are themselves taking up the construction of dynamo electric machinery, claiming good results obtained for direct connected apparatus when engine and dynamo are built by the same company and assembled before leaving the works. The J. H. McEwen M'f'g Co., 26 Cortlandt St., New York, is one of the firms that have entered this field. They have made some recent improvements in the details of their engines, notably in the governor and cross head. Figure 2 is a cut of their governor, which is extremely simple, having but one bearing, and that a roller pin bearing, which requires no lubrication.

Figures 3 and 4 show the construction of their Cross Head. The shoes are held in position by eccentric bolts. Both upper and lower guides, as well as cross-head pin, are oiled from stationary sight-feed oil cup on top of frame. The oil is wiped off by upper shoe, and is caught in oil groove shown, extending across face of shoe, and led through oil holes at each end of grooves to inside of upper shoe, thence to a funnel-shaped oil hole in strap of cross-head box to cross-head pin; from there it drops to lower shoe and then through holes in this shoe to lower guide.

Their Thompson-Ryan dynamo represents a radical departure from the beaten tracks of dynamo design, differing in nearly every detail of construction from the ordinary type of machine. The most important feature is a set of series windings surrounding the armature, and termed balancing coils. This feature, which is the invention of Prof. Harris J. Ryan of Cornell University, was introduced for the purpose of balancing armature reaction.

At first thought it would seem that the addition of balancing coils to a dynamo would complicate the construction to a certain extent. The manufacturers claim that is fully offset by the simplification of the machine in other respects. The field castings of these machines are of steel and consist of but three pieces which are held together by four bolts. One of these castings is the "pole ring," shown in Fig. 5, through which the balancing coils are wound, and the other two constitute the field ring proper, Fig. 7.

The balancing coils are wound in such a way that the current passes through them across the pole face in the opposite direction from the currents in the armature conductors, and thus the magnetic effects of the armature currents are neutralized.

Fig. 6 is a view of the completed pole ring. The field ring, Fig. 7, shows on its internal periphery the "pole necks," around which the coils are placed. It will be seen that the field ring is of such a shape as to entirely enclose the field coils, thus thoroughly protecting them from mechanical injury. It will be noted also that the space in the field ring allowed for the field coils is unusually small. This arises from the fact that less than one-fourth as much energy is required to magnetize the fields of this dynamo as is necessary for a machine of equal capacity of ordinary design. On account of the very small amount of field energy required, the rise in temperature of the field coils is very slight, notwithstanding the fact that these coils are so nearly surrounded on all sides.

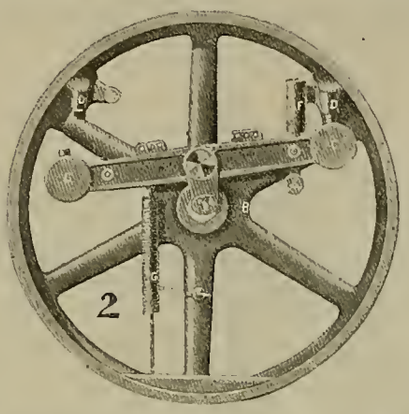


Fig. 8 gives a good idea of the appearance of the finished armature core.

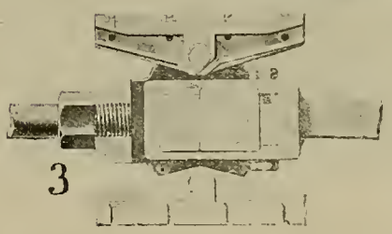

Fig. 9 is a view of the completed armature for a 200 K. W. direct connected railway generator.

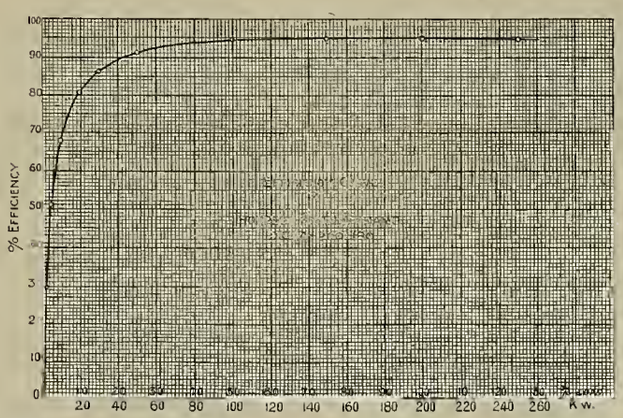

Fig. 10 is a view of complete brush-holder arrangement. The brush-holders project outward, and leave the entire outer end of the commutator free and accessible.

The only leads employed on the whole machine are one from the negative brush-holder ring to the negative terminal, and another from the positive brush-holder ring to the inner end of the balancing coils.

The whole brush-holder arrangement is adjustable around the commutator, and by loosening the clamp-bolts the brushes may be shifted backward and forward. This is only done, however, for the purpose of adjusting the compounding of the machine. By shifting the brushes in this way the machines may be adjusted through a range of from 10 per cent drop at full load to 10 per cent rise, and this without any effect whatever on the commutation.

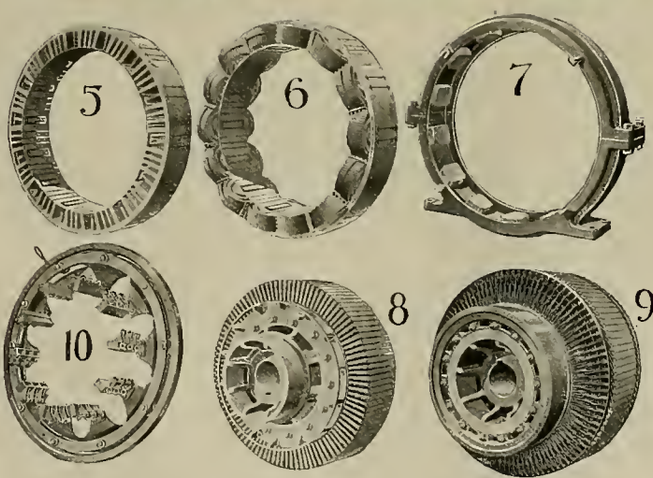

Fig. 11 shows a curve of commercial efficiency taken from actual tests of a Thompson-Ryan 200 K. W. railway generator. The peculiar features of this curve are not so much the good efficiency under heavy load as the unusually high efficiency under light loads, and the very great range of uniform efficiency. This is due to the unusually small fixed losses, the result of the very small field energy consumed and the light core losses.

Another important feature of this dynamo is the great ease with which two or more machines may be worked in parallel. The design of the machine peculiarly fits it for this sort of service. They may be thrown in parallel while differing widely in voltage produced, and each machine will take its due proportion of the load, notwithstanding the fact that they may be greatly over-compounded. Two or more of these machines will work perfectly in parallel, and divide the lightest load evenly or maintain perfect unison with the entire load thrown off.

Canal Electric Traction for Army Purposes.

A point of great importance as bearing on the wide extension of electric boat propulsion now in prospect in this country, resulting from the great success of the tests on the Erie canal, has arisen in France. For the last two years an electric canal-boat has been successfully operated on the Bourgogne canal, which unites the rivers Yonne and Saone. The electric motor on the boat receives current from an overhead trolley circuit. So satisfactory have been the results of this comparatively ancient system that the French Government has been asked to consider the facilities which would be afforded for mobilization and the transport of any supplies if some system of electric traction were provided on the canals leading to the frontiers. A leading French journal, after remarking on the superiority of water transit for the removal of the wounded, says that the canals leading to the eastern frontier of France would be able to take the heavy transport of five army corps, and considers the question of the general electrical equipment of the canals worthy of the attention of the military authorities.

Can the Voltage of Incandescent Lamps be Safely Raised.

Since incandescent electric lights first came into general use, it has been usual to employ therewith one particular voltage. The quantity of current, as measured in amperes, would vary, according to the number of burners to be kept alight; but whether these were few or many, the pressure at which the current was forced through the conducting wires and the delicate carbon filaments of the lamps was generally 110 volts. It was necessary that the dynamo, filaments, supply wires, safety fuses and other incidental features of the whole system should be adjusted with great precision to this voltage, which, compared with that of electric currents used for some other purposes, is very low, and, consequently comparatively safe.

Within a year electric lighting companies have been considering the advisability of employing a 200-volt or 220-volt current for incandescent service. The higher the voltage is, the more current a wire of a given size will carry. The copper of which such wires is made is a costly material, when used in large quantities, and for power transmission it has long been customary to effect economy by increasing the voltage. But ten years ago, when the great boom in electric lighting started, it was deemed expedient to use a low tension or low pressure current in the interests of safety. Now, however, so much higher voltages are used for other purposes that the civilized world is getting used to them, and the temptation to abandon the old standard for incandescent lighting, in order to increase the amount of service of existing lines, is natural.

If the only question involved in the proposed change related to the substitution of other dynamos for those now in use at the central station, there would be no reason for hesitancy. But there are several serious problems to be settled before a new policy is adopted. Some of these pertain to the manufacture of lamps suited to a current of higher voltage. While they are being made, the burners are subjected to tests in which 400 or 500 volts are required. Consequently the workman is exposed to greater peril. Greater care would be required, and this means a more expensive product. An enlargement of the pear-shaped globe might also be necessary, which would result in a loss of beauty if not another increase in cost. The consumers might not view such a change with favor, unless it were attended by a reduction in the charge for current, and nothing of that sort appears to be intended. A more serious matter is the possibility that the insulation of the wires in the houses, offices, and shops of consumers, while adequate to present needs, might develop defects that would lead to serious accidents were the voltage increased. The joints of a water pipe or steam pipe might stand a pressure of 100 pounds to the square inch without leaking or bursting, and yet succumb to a pressure of 200 pounds. Just so an electric current might stick to its conductor pretty faithfully at one potential, and overstep the barriers of insulation at

some weak point if that potential he doubled.

There are two other points considered: Much of the incandescent service is afforded by the three-wire system, under which two sets of lamps are operated, one with a 100-volt positive current and the other with a 100-volt negative current. Each has its own supply wire, but both use the same return wire. The arrangement really establishes a difference of poteutial equal to 200 volts hetween the supply wires. It is as if we had a pressure of 100 pounds in one water-pipe and a suction of 100 pounds in another beside it. The resultant strain between them would equal 200 pounds, although the strain hetween either one and a third pipe which was neutral would be only 100. Now, if the voltage for each of the two electric circuits of a three-wire plant he raised to 200, the potential hetween two of the wires of the line would be 400. Nor is there any certainty that matters would stop here. While electrical engineers talk about douhling the voltage, they are thinking of trehling it, and this means a strain of 600 volts, which is greater than that (500 or 550) hetween an ordinary trolley wire aud the return line afforded hy the earth. In all new wiring the increased risks cau be easily provided for; but misgiviugs ahout the condition of some of that already done are excited hy the recent agitation.

Electricity in Powder Mills.

"The appetite comes while eating," say the French, and that the same principle may he truly applied to the use of the electric motor is emphasized by certain experience which the General Electric Company has recently had with the Ætna Powder Company, of Ætna, Ind.

In November, 1894, this powder company decided to install two small slow speed generators for operating incandescent lamps on the Edison three-wire system. As these could not he delivered immediately, two second-hand machines were installed temporarily, and before the first two new ones ordered could be delivered, the order was changed to two larger moderate speed generators, with the privilege of changing them for two still larger ones. In June, 1895, the last two were ordered, together with two motors, one of one-horse power, the other of five-horse power. On August 2d, the Ætna Company ordered another motor of five-horse power and on August 14th, still another of the same capacity. The company having enlarged its plant during the summer found its electrical installation insufficient, and on October 12th ordered two forty-five Kilowatt moderate-speed generators, and two moderate-speed motors; one of twenty-horse power, the other of thirty-horse power. Thus, within one year electricity had given the powder company such satisfaction that it now has sixty-six-horse power in motors and uinety-three incandescent lamps taking current from the two forty-five Kilowatt generators. The one-horse power and the five-horse power motors are used to drive small mixing machines in the manufacture of dyuamite. The thirty-horse-power motor operates a large machine used for pulverizing nitrate of soda and the twenty-horse power runs a number of machines such as the dry pan and mixing machine. The powder company found that the first five-horse power motor, which they subsstituted for a steam engine, really performed a duty with which the engine found difficulty in doing.

The recent gradual increase in the use of electric power in powder mills is especially noteworthy. During the past year the General Electric Company has equipped several with electric motors.

THE longest telegraph line in the world ahove ground and without a hreak, has just heen completed in Australia. It runs from Rockhampton in Queensland, to Broome in Western Australia—a total length is over 6000 miles.

Practical Information.

Brazing.

In a late number of the *Machinist* a correspondent inquires regarding brazing. With your permission I will give him a few ideas of the art, says a writer. As he has only a charcoal fire his brazing must he on the top and hottom, or where the heat is applied, conscquently he must be on guard, or he will hurn his work hefore the brass melts. He can get brass grauulated from dealers in machinists' supplies. It comes in four sizes—coarsc, medium, fine and extra fine. Medium will cost forty cents per pound. If he does not do enough to make it an ohject he may take any sheet brass or hrass wire, and with a coarse file he can in a short time make enough to do a small job with.

Borax he can get at any drugstore, and hy pounding it fine and placing on a shovel in a moderate heat he can expel the moisture, when he can again grind it as fine as he choses; that is, provided he cannot get the pulverized. Before applying the brass solder he had better wet the article to be brazed, and theu dust the pulverized horax in liheral quantities over the joint to he made. With an iron he can transfer the borax along the seam, then when melted he can take his brass solder already mixed with pulverized horax, and distrihute along where the joint is to be closed, and when it is reduced to a flowing or molten state remove from the fire. After it is cooled he can clean hy immersiug the joh in a pickle of sulphuric acid and water, taking care not to have it strong euough to attack the iron and steel. The object of the borax is to prevent scaling of the iron and oxidization of the brass solder, which latter will otherwise he burned up, and no good done. I have never had any difficulty in doing this class of work, in fact, had rather do it than attempt to mend a rusty wash-hoiler with tinners' solder.

He must remember that in all cases the article to he hrazed must have greater heat-resisting power than the solder or the article will melt first. Brass solder is only copper and spelter, same as low brass, and is used by those doing large quantities of work on account of its convenience. The pickle attacks the melted borax, and cleans the work ready for the file. Otherwise the file will soon go to the bowwows.

Metalloids.

Chemically pure iron is of no value to the manufacturer, for, strange as it may seem, it is the impurities in iron which make it the most valuable and important of metals. These impurities are metalloids. The metalloids which are particularly interesting to the foundryman are carbon, silicon, manganese, sulphur and phosphorus. A good foundry pig iron for general purposes should contain from 3.25 to 3.5 per cent of carhon, from 3 to 3.25 per cent of silicon, from 5 to 75 per cent of manganese; the phosphorus may run as high as one per cent, hut sulphur should never exceed .05 per cent. The hlast furnace that supplies the pig iron to the foundryman is supposed to analyize its iron, and the foundryman, if he is conducting his business according to modern practices, orders iron with reference to carhon, silicon and manganese, according to the nature of the metal he desires to put into his casting. The market price of pig iron generally depends on the percentage of silicon it contains.

BRITISH STEAMERS are loading cargoes of iron at Mediterranean ports for Philadelphia. The shipments aggregate 100,000 tons of ore. Contracts have heen made for that amount of the raw material for use in Pennsylvania furuaces. The cargoes come from Seriphos, Benisaf, Elha, Bona, Carthagena and other ports in Spain, Greece and Italy. Freights are ten shillings per ton from Seriphos and nine shillings from the other ports. They are mostly steamers run on monthly time charters.

The new mines of the Spanish-American Company, which were recently started, have vessels now regularly engaged in the trade. The leading point is at Dalguiri, fifteen miles to the eastward of Santiago de Cuba. The Juragua Company, which was the first to ship ore from Cuba, has a regular line of steamers which load ore in Santiago bay and take outward cargoes of coal to other West Indian ports.

THE Treasury Department has at last announced that the World's Columbian Exposition medals and diplomas would he ready for delivery by the exposition commission some time in February next. and, acting under authority of the last sundry civil bill, persons receiving medals are entitled to electrotypes of the same on payment of the cost.

Railroad Statistics.

An epitome of the seventh annual report on the statistics of railroads in the United States for the year ending June 30, 1894, is furnished. The report, which is the work of Henry C. Adams, statistician of the Interstate Commerce Commission, is of unusual interest. It shows that on June 30, 1894, there were 178,708.55 miles of road in the United States—an increase over the previous year of 2147.48 miles—the per cent of increase heing smaller than during any year covered by the existence of the Interstate Commerce Commission. There is little to warrant the hope that the increase in mileage for the year ending June 30, 1895, will exceed the figures of the previous year. Of the entire mileage, 40,818 were iu the hands of receivers.

Illinois leads the country in the length of its lines. In that State the total mileage is 10,460.58. Pennsylvania follows with 9594.39 miles and Texas is a close third, having 9264.34 miles of tracks. Tennessee has 3064.59; Mississippi, 2478.16. Louisiana's mileage is the shortest of any Southern State, heing 2050.51. Rhode Island, heing the smallest State, has also the smallest trackage—226.06 miles.

The column showing the number of miles of tracks to 100 square miles of territory gives some peculiar results. New Jersey has 28.91 miles to every 100 square miles. New York has 16.95, Illinois 18 68 and Texas only 3.53. Nevada has only 0.84 miles to the 100; Tennessee has 7.34, Mississippi 5.35 aud Arkansas 4.65.

The number of miles to 10,000 inhabitants is calculated, and the results are equally as interesting. Montana has 191.73 to this number, Massachusetts has 8.77, Illinois 25.32, Texas 38.38, Tennessee 10.06, Arkansas 20.25, Mississippi 17.80. Rhode Island has only 6.06 miles for every 10,000 people in the State.

The number of locomotives on June 30, 1894, was 35,492, being an increase of 704 over the previous year. The total number of cars in use on June 30, same year, was 1,278,078. This does not include cars of companies or private individuals furnishing railways with equipment. The increase over 1893 was 4132. This is a falling off in the ratio of previous years, but it is to he remembered that larger cars are heing made and therefore capahle of greater tonnage.

The section devoted to the employes of railroads shows that the number of men in the service for the year ending June 30, 1894, is less than for any other year as far hack and including 1891. On June 30, 1894, 779,608 persons were in the service of railroads; in 1893 there were 873,602; the previous year, 821,415, and in 1891 there were 784,285 persons in railroad service. In 1894 there were 5257 general officers—a reduction of 1400 from the previous year.

Thus it will he seen that hard times, like death, slighted no class. The biggest proportionate reduction was in this class. In 1893 there were four general officers to the 100 miles, while last year there were only three. Office clerks were reduced from 27,584 in 1893 to 24,779 in 1894. Station agents in 1894 numhered 28,199, but this class was increased 180 over the previous year. Other statiou men in 1894 were 71,150—a reduction of 4000. Engineers in 1894 were 35,466; in 1893 they were 38,781. Firemen were reduced from 43,590 to 36,327 in 1894. In 1894 there were 24,823 conductors—a reduction of 3000 in round numhers; other trainmen, 63,417—a reduction of about 10,000. The following shows the number of men in various other departments, the first figures heing for 1894, the second for 1893: Machinists, 29,245–30,869; carpenters. 36,328 41,878; other shopmen, 84,359–93.709; section foremen. 29,660–29,699; other trackmen. 150,711–180,154; switchmen, flagmen and watchmen, 43,219–46,048; operators and dispatchers, 22,145–22.619; employes floating equipment, 7469–6146; all other employes, 85,276–105,166; unclassified, 284 for 1894. The total for 1894 is 779,608; for 1893 it was 873,602; total reduction, 93,994. What hecame of this number of persons thrown out of work by the hard times? The greatest aggregate decrease was in the States of Ohio, Indiana, Michigan, Illinois, Wiscousin, Iowa and Minnesota.

There was in most cases a reduction of salaries in 1894. The following table shows the average daily compensation for the three years:

	1894.	1893.	1892.
General officers	9.71	7.84	7.62
Other officers	5.75	.....	.....
General office clerks	2.34	2.23	2.20
Station agents	1.75	1.65	1.68
Engineers	3.61	3.66	3.68
Firemen	2.03	2.04	2.07
Conductors	3.04	3.08	3.07
Other trainmen	1.89	1.91	1.89
Machinists	2.21	2.33	2.20
Carpenters	2.02	2.11	2.08
Other shopmen	1.69	1.74	1.71
Section foremen	1.71	1.75	1.76
Other trackmen	1.18	1.22	1.22
Switchmen, flagmen and switchmen	1.75	1.80	1.78
Telegraph operators and dispatchers	1.93	1.97	1.93
Employees—account floating equipment	1.97	1.96	2.07
All other employees, laborers	1.65	1.70	1.67
Unclassified	.....	1.64	1.57

Referring to the averages for the entire year, it appears that the only class of employees which received compensations in excess of $3 per day are enginemen and conductors. General office clerks, firemen, machinists and carpenters received hetween $2 and $3 per day; all other employees were in receipt of a compensation less than $2 per day. In the case of employees assigned to the operation of floating equipment the averages presented in the ahove table are somewhat misleading, inasmuch as there is no attempt at classification hetween skilled and unskilled labor.

It may be an occasion of surprise that the commercial depression of the year 1894 did not cause a more marked decrease in the average compensation of employees. This is douhtless explained by the decrease in the number of men employed. The saving in the payroll was achieved hy the reduction in wages. So far as the movement for the three years covered hy the compilation is concerned, it appears that in most cases the average rate of compensation was higher in 1893 than in 1892, and, although the year 1894 shows a decrease, it still remains higher in some groups, for quite a number of classes, than in 1892.

The total railway capital ou June 30, 1894, was $10,796,813,000. The amouut of capital to each mile of line was $62,951. In 1893 it was $63,421. The funded debt per mile was $31,233. The aggregate of stock was $4,834,075,659. The amount of stock per mile is $28,186.

For 1894 there were 540,688,199 passengers carried, and 638,186,553 tons of freight hauled. The total earnings for 1894 were $1,216,178,602. This is a decrease of $154,222,887 from the previous year, or 11.25 per cent.

The chapter on the numher of persons killed conveys some peculiar information. The total of passengers, employees and others killed in 1894 was 6447; injured, 31,889. These figures are lower than for three previous years. There was one trainman killed to every 156 in the service, and one out of twelve was injured. The numher of passengers carried for one killed last year was 1,668,781. Last year 251 persons were killed in coupliug aud 7240 were injured.

Mining Summary.

CALIFORNIA.

Amador.

THE PIONEER, PLYMOUTH DISTRICT.—*Ledger:* The Pioneer mine at Plymoutb, owned by Dr. Tbos. Boyson, has been sold to the Pioneer Gold Mining Co., which numbers among its subscribers some of the most prominent stockholders of the Kennedy Company. Tbe French syndicate on the 30th ult. wired the doctor, offering to pay an installment of the purchase price and the remainder in thirty days, but Dr. Boyson refused to alter the terms of his agreement with them and immediately organized tbe new company under the auspices of Messrs. Barton, Curry, Goodwin and Reichling.

ENOCH, PINE GROVE.—E. A. Trask, owner of tbe Enoch mine at Pine Grove, has just had a crushing of fifty tons of ore from bis mine made at the Reward mill, from the proceeds of which he shipped a little less than $1000 in free gold. He bas purchased a three-horse power gasoline engine to use in his tunnel for hoisting and pumping.

NORTH GOVER, DRYTOWN. — An agreement has been prepared by tbe owners of the Nortb Gover and Mr. Purington to transfer tbat property for $25,000, to be paid witbin a year, and sent to Col. Isaac Trumbo for bis inspection and signature. This property joins the Gover, on which Col. Trumbo is now operating, and can be worked from the latter property very economically.

UNION CONSOLIDATED, CLINTON DISTRICT.—The Union Consolidated Gold Mining Company has been incorporated to operate tbe Clinton Consolidated mining properties. Work is now in progress. Enough square timbers are on the ground to sink 300 feet, and sinking will be commenced by the new company as soon as the hoisting plant is moved to more solid ground, and otberwise put in good order.

THE ONEIDA, JACKSON DISTRICT.—The old incorporation, the Oneida Mining Company, bas taken on new life. Tbey have filed in the Clerk's office a certificate of the increase of stock of the company to $3,200,000.

Butte.

At Forbestown tbe Denver mill has begun crushing quartz. Twelve men are employed in the mill and mine.

The Bullion is running and a full crew of men is busy at tbe Goldbank.

Calaveras.

THE FELLOWCRAFT MINE. — *Citizen:* The new hoist at tbe Fellowcraft mine is in operation. The water force is about twice as strong as is needed. The pipe taps the Treat ditch about 1700 feet from the top of the bill. and has a good fall all the way. At this point it is run into a reservoir wbere another pipe conveys it 200 yards farther down a very steep hill to the wheel.

CHRISTIAN GULCH PLACERS.—Great activity is reported in placer mining at Christian Gulcb. Four placer claims are being actively worked and all are paying well. About a month ago one of the miners took out a nugget weighing $247. Forty and fifty dollar nuggets are quite common, wbile smaller sizes are never commented on. Tbe gold is of the coarse channel variety.

El Dorado.

AROUND PLACERVILLE—(Special Correspondence).—Propositions have been submitted by Eastern people for the purchase of the Salisbury mine.

Stephens & Carmody have bonded the Mammoth and Boulder properties from Jergens & Blair, in the southern part of the county, and erected a ten-stamp mill. They have an eight-foot ledge at forty-feet, which averages $10 per ton.

The Georgetown divide is coming to the front with its gravel and quartz mines, now in course of development, and will make a good showing.

The Church mine will add thirty stamps to its plant, making forty in all. Work has already begun on tbe improvement. A new vein has been discovered, running from the surface to the 1200 level.

The Grand Victory has opened another new ledge of very high grade ore.

The following is a careful and conservative estimate of moneys expended in El Dorado county during the past eleven months in the development of mines, the erection of plants, and their operation:

For machinery and improvements	$610,500
For water	35,000
For fuel	30,500
For labor in mills and mines	450,000
Repairs and supplies	50,000
Sawmill output (for mines and mills)	25,000
Total	$1,201,000

Tbis does not include the purchase price of properties.

The Rose Kimberly, twelve miles soutb of Placerville, in the Jay Hawk district, owned by San Francisco people and capitalized at $1,000,000, is about to be operated on an extensive scale. Tbe shaft, at present 200 feet deep, will be sunk 300 feet deeper. The vein is five feet wide, and the ore assays $15 per ton. Tbe capacity of the present mill, used for prospecting, will at once be increased. Negotiations are now ou for the erection of a compressed airplant.

Mono.

At Lundy there are 40 men working in the Jackson and Lakeview mines and about ten in the mill. Besides the stamps and chlorination plant there are five concentrators.

At the Copper Mountain they are raising from the lower to tbe upper tunnel—700 feet. A hlower is being put in.

The Hydraulic, near Copper mountain, is looking well. In former days R. N. Graves sunk nearly $70,000 on tbis property. It has been idle for tbree years but now Mr. Graves has encountered high grade, coarse gold, and is juhilant over the prospect. He has taken up reservoir rights and will build dams in the spring.

Work is suspended at Mammoth until spring. The mill is nearly completed, but as the material is exhausted Mr. Hammond concluded not to order any more until the snow season is past.

AROUND BODIE.—Tbe Standard and Syndicate cyanide works and Syndicate mill and mine have closed down for the winter.

The Bodie Tunnel mill is running steadily on custom ore, most of which was taken from the Bodie Tunnel mine by the different lessees.

The Southend cyanide is making its last clean-up, and will close till spring.

Bodie shipped more bullion during November tban for any other one montb in over a year.

Fresno.

COPPER KING.—The Los Angeles Petroleum, Smelting and Mining Co. have bought tbe Copper King mine, 30 miles east of Fresno, and will build smelting works. There is a 6-ft. body of ore, mining 10% in copper, $10 in gold.

Nevada.

Tidings: The outlook at the Lamarque mine is now so encouraging that fifteen additional miners are to be put on. They will run drifts on the 300-foot level, and the rock will be sent to some adjacent mill to be worked.

Transcript: The Republic, National and Culbertson mines are all on tbe same lode, which runs north and south, with an east dip at an angle of sixty degrees. The casings are greenstone and porphyry, the greenstone lying on the foot. Tbe ore veins are from three to ten feet on this lode, which is about two miles long. On the National mine the shaft is down 180 feet. Tbere is a fine ore body, and the five-stamp mill is kept running night and day. The ore is well milled and averages about $7 per ton. There is enough quartz in sight to keep a twenty-stamp mill running.

In the Culbertson mine, which adjoins the National on tbe nortb, the shaft has been sunk to a depth of 160 feet, and levels run north and south, all in ore, yielding about $8 a ton. Tbere is a new ten-stamp mill tbat is kept running day and night.

AT WASHINGTON.—*Herald:* At the Oak Tree mine, ten stamps are now running on fair-grade ore.

At the German tbe main tunnel is being extended, and a raise for air between the main tunnel and the old works above is partially completed.

Supt. Johnson reports everything at tbe Spanish going satisfactorily, though tbe depth of snow is something of a drawback to them.

At the Gaston Ridge, Supt. Harmon thinks, at the expiration of ten months' time, be will have tbe entire 1800 feet of lower tunnel completed.

At tbe Mountain View mine the workers are extracting milling ore.

The Derbec Mining Co. has bonded tbe Bishop mines at Bangor.

Work has been resumed on the Rocky Bar mine at Washington.

Placer.

STRUCK RICH GRAVEL.—*Herald:* Tbe North Fork Co., who are running for gravel near Forest City, struck tbeir channel recently, and it was so good tbat half the town went up to take a look at it. Superintendent Jones and the company are more tban pleased with their prospects now, as tbe gravel is rich enough to make every carload pay well.

"Nine carloads that were washed a few days ago yielded $26.85," says Mr. Page, wbo is the chief promoter of tbe enterprise, "and even then we could not clean the bedrock, as we were working in water." As the North Fork is a tunnel proposition, it will be seen that this is good pay. Mr. Page thinks that they will be able to extract and wash gravel for about 65 cents per carload.

The gravel bed is 4½ feet thick where they are working now, and they have run into it 29 feet. Tbe company has over 11,000 feet of this channel.

Plumas.

A shipment has been made of 3400 lbs. concentrates from the Shenandoah mine for reduction, representing 24 tons roasted ore.

Riverside.

MORE GOLD FOUND.—A topic of local importance is the new discovery at the Leon mine, six miles southwest of Winchester. S. R. Porter, president of the company, reports that tbe owners are highly elated over the prospect. Stock in the mine has advanced from 50 cents to $1 a share.

San Diego.

AT JULIAN.—*Sentinel:* Tbe Venturina Mining Company has men at work fixing up the mouths of the two tunnels which they propose to run into the hill to tap the ledge. The upper tunnel will he 400 feet long and the lower 550 feet. They will cut the vein 200 and 350 feet below the surface. Tbe Fraction mine has been recently purchased by the company and lies above the Cahle. The tunnels being run for the development of the latter will cut the ledge of the Fraction farther on in the hill, so that both mines will be worked together. The ledge of the Cable mine is about a foot wide and several good crushings of ore, averaging about $25 a ton, have been taken out. When preliminary work has been done, it is proposed to put on a larger force of men.

A force of eleven men is at work on the preliminary operations at the Owens mine and the shaft has been retimbered down to the water line, 175 feet from the surface. The large building which covers the hoist and the machinery connected with it, is nearly completed and work can now be carried on uninterruptedly, regardless of weather conditions. The pumps will be set to work in a few days, and it is expected that in the course of a month or so ore will he taken out. The mill and other appliances have been put in good order.

Shasta.

SALE OF GRAVEL CLAIMS.—*Free Press:* Dr. O. H. Simonds and Isaac Baer, Colorado capitalists, have completed the purcbase of the Doeblin, Berkenfield and Reed placer claims, located about a mile and a half above old Horsetown, on Clear creek.

Tbese claims embrace 300 acres of rich gravel, and tbe purchasers, before they can successfully work the property, will bave to build a pipe line about six miles to utilize tbe waters of Brandy and Boulder creeks, which will cost about $18,000.

Tbe Ancient Channel Drift Mining Company have 200 feet of their tunnel completed, and are now upraising to strike the pay gravel in their mine on Dog creek.

The railroad from Keswick to tbe Iron Mountain mine is expected to be completed next week. The smelter is being erected and active operations will shortly begin.

Sierra.

THE PRIMROSE.—W. McNaughton has four men on the Primrose, running a tunnel 300 feet, near tbe old millsite, north.

Siskiyou.

MINING NOTES.—*Journal:* The cold weatber of the past few days has stopped the flow of water in the small streams and ditches, by freezing, but a change may be anticipated shortly, as the freezing spells seldom last more than a few days at a time. Tbe cold weather will be all tbe better for mining in the end, as it will keep tbe snow on tbe mountains from melting too rapidly and causing dangerous and damaging floods.

The underground mining in drift and quartz claims continues right along, regardless of weather, in getting out rich pay gravel and quartz. The gravel taken out can be washed in tbe sluices when a good head of water is available, and tbe quartz can be crushed in the steam and water power mills when most convenient.

There is already sufficient snow on tbe mountains to prove a good fountain in supplying water, with our season of heaviest snow and rain storms still to come later, especially about New Year's and during January and February.

The American Mines Association of Chicago, with C. E. Gates as president and H. C. Latshaw, vice-president, M. L. Williams, secretary and treasurer, together with tbe old Gold Ball Mining Co., has erected a twenty-stamp mill at the Gold Ball mine, on Salmon river, under the superintendency of E. Durham, a mining man sent out by the American Mines Association.' They have also erected six tanks for working ore under the cyanide process. Tbese tanks were erected by R. D. George. This is one of the best properties on Salmon river, and these extensive developments will enable its owners to work the mines to tbe greatest advantage.

The pumps at the Espey Hunter mine on Sbasta river have not started up yet. It has been quite an undertaking to repair tbis heavy machinery.

The arrastra of Scbeld & Steele on Long gulch bas been completed, and they are now busy taking out rock. This rock pays exceedingly well, some of the ore going $100 to the ton.

Tbe Blue Gravel mine is now clear of water and the force is busy putting in new tracks and switches. It is expected tbis work will be completed in another week, and tbey will then commence taking out pay dirt.

Tuolumne.

THE BELLEVIEW MINE.—*Banner:* The mine under the management of A. N. McDonald is a dividend paying property. The Belleview does not depend on water supply to keep it in operation. The mill is run by steam power.

Trinity.

TUNNEL FINISHED.—*Journal:* Smith & Ringwood have finished their contract with the Lagrange Company for running a tunnel on West Weaver. They began September 17th and finished December 5th. It is 462½ feet long, 6 feet high and 5½ feet wide.

Yuba.

Messrs. Mowatt and Chapin, representing the S. F. Quartz Mining Co., are developing the company's property near Timhuctoo.

NEVADA.

LINCOLN COUNTY.

INCREASING THE CAPACITY.—The DeLamar Company has douhled its crushing capacity at the mill, says the Pioche *Record.* A new crusher of largest size was started up a few nights ago. Two new boilers of 250-horse power are heing put in plaee alongside of the two old ones. The next step will be the addition of extra pulverizers and leaching tanks to bring the works up to the promised 150 tons a day working capacity.

OREGON.

BAKER COUNTY.

Ira S. Schenck of Minnesota, has hought the Ohio mine, an adjoining property to the Columbia, in the Cracker Creek district, representing citizens of Minnesota. The officers are: President, B. H. Hinkly, Secretary, L. M. Manchester. The mill will he erected in the spring.

SOUTHERN OREGON.—Gold Hill *Miner:* The Daisy mine is again in a fair way to pay a good dividend.

There are now dozens of men with pick, shovel and rocker working along Rogue river. Many of those men have tents stretched, and one can see their camp fires hurning while they are engaged in their work along the water's edge. There is no limit to tbe amount of paying ground up and down the river and the day is not far distant when the ground will be worked on a larger scale. Some parties bave already been experimenting with water wheels for throwing water in quantities sufficient for placer work. What is needed is a great canal, furnisbing water sufficient for all.

The Lance Mining Company, which bas purcbased 700 acres of George W. Lance, at tbe outlet of Footes creek, is rushing work in putting the mine in working order. Tbey are cutting a raceway 2000 feet long and twelve feet wide, to reach Rogue river with the tailing. They bave let the contract for 600 black and 30,000 feet of lumber for flume. They bave also let the contract to build a reservoir covering six acres, and for ditches about six miles for sluicing and piping purposes. Tbey bave placed an order for 2000 feet of fifteen-inch pipe, expecting to be piping in February.

Twenty-five men have steady employment in and about the mine at Riverdale, twenty miles south of La Grande. The mill is running steadily night and day and will continue in operation until it freezes up. Tbe mine this winter will be tapped at a greater depth, and other prospects in the district developed.

AT GRAND RONDE.—Superintendent Morcum, of tbe Grand Ronde Placer Mining Company has cleaned out a ditch six feet across the top and four feet in depth for a distance of six miles, it is readiness for spring work. 1200 feet of pipe bas been laid and five giants are at Hilgard to be taken to tbe mines.

BRITISH COLUMBIA.

CHARACTER OF ORE CHANGING.—As greater deptb is attained in the mines about Rossland tbe character of tbe ore, as usual in all mining camps, is changing. Sulpbide ore mixed with quartz is one of the characteristics of the new shaft in the Le Roi. Ore of tbe same character bas been found in the War Eagle, Center Star and Josie.

ALASKA.

Record: Tbe Treadwell is pounding out its million per annum; the Mexican follows with a full quarter of that sum; four little stamps at the Bald Eagle put out $700 every twenty-four hours during tbe season; tbe several mills in Silver Bow Basin grind away upon ore which yields its yearly balf million; Sbeep Creek adds no small sum to tbe output; hundred-weight shipments of bullion are by no means infrequent from tbe Berner's Bay mines; the forty stamps at Unga contribute sums of heavy proportions; Golovin Bay sends to California smelters shiploads of silver ore rich enough to pay bandsome profits even at the present depreciated price of the white metal; tbe Yukon will show up no less than a round balf million for the past season; the placers in Silver Bow Basin, at Lituya Bay, at Cook's Inlet and in every nook and corner of the territory, add tbeir hundreds and thousands to the annual output, to say nothing of the hundreds of claims awaiting only development to become paying properties.

IDAHO.

SHOSHONE COUNTY.

(Special correspondence).—Pierce City has another stamp mill pounding away on free milling gold ore from tbe Idaho mine which is now under a fair way to develop into a large gold producer. Tbe ore body is not so large in the tunnel as it was in the sbaft, but the ore is far richer, free gold being visible in quite a few places in the vein. The formation in the Idaho is granite; trend of tbe vein is from the northeast to the southwest, similar in that respect to most of tbe other known veins in tbis camp. The Bond mine, owned by Dunn Bros., is now working three shifts in the mine, and is giving employment to about 18 men. They are producing lots of gold; the cleanup last month for three weeks' running time being 190 ounces of gold, and the ore averaging close to $90 a ton. Another discovery has been made near the Bond mine by C. Henley and J. Morrow. Mr. Morrow sold out his interest to parties from Moscow for $800. The vein is very small, hut high-grade, showing free gold. A mill test of a few tons at the Dunn mill turned out very satisfactorily to the owners. There are three men at present at work on this property, and the owners intend putting a mill on next spring, if the ore shows up as good with a little more development. The formation in this camp is principally granite, with dyke porphyry cutting the formation is all directions. There are also reefs of hard granite cutting the formation from the east to the west; also reefs of syenite in various parts of the camp. The placer gold found in tbe various gulcbs of this camp is different in every gulcb, which, together with tbe local wash or gravel, indicate that the gold is local.

Statesman: The Hidden Treasure Mining Company in Neal distriet has let a contract to run a 500-foot tunnel to open the vein at greater depth. Tbis is to he a crosscut and it will develop the property 150 feet vertieally below the present workings, or 300 feet below the outcrop of the vein.

GOLD AND TIN.—John Donaldson, Prairie Basin, Lemhi county, managing the Prairie Basin placer mines, has constructed a ditch a mile long, and a flume 1000 feet in length. Hydraulies will be used and a 115-foot pressure has heen ohtained. This placer comprises 1000 aeres of gravel. A reported feature of these gravel beds is the presence of stream tin. In places the yield in tin is 70 per cent.

THE CŒUR D'ALENES.—*News:* At the Standard mine on Canyon creek there are eighty men employed, all told. The Campbell tunnel is in 800 feet. This will require a total length of 2587 feet to cut the lode, which it will intersect at 436 feet in vertical depth below the Banner tunnel. Next week the Standard mill will close down for about six weeks to

permit of improvements. This will stop the stoping in the mine for that period.

At the Gem sinking is the only work in progress. They have just made a record of eighty-five feet in thirty days. The shaft now lacks sixty feet of the third level, when a station will be blasted out and a full crew of about 130 men put on. This will probably occur some time in February. The property now employs thirty-five men, all told.

The Hunter mine at Mullan started up a week ago, but the cold weather of Sunday froze them up again. On Monday the mine was closed for the winter. Nearly all of the men have gone into winter quarters, with the expectation of starting up again some time in February.

At Wardner the mines are running along without friction or incident of any kind, except the monthly pay days. The Last Chance paid out $10,000 to its employes yesterday.

The owners of the Wyoming are doing some development work this winter. They have a tunnel 100 feet long and several crosscuts and raises, all in ore.

The Morning is working about ninety men, and is running from 220 to 240 tons of ore through one side of the concentrator daily.

MONTANA.

PRODUCTION FOR 1895. — Following is the Butte *Miner's* estimated production of Butte in copper and silver for 1895, using the product for the first eleven months as the basis.

Anaconda Company:	
Copper, 110,000,000 lbs at 11c	$12,100,000
Silver, 3,150,000 oz. at 66c	2,079,000
Boston & Montana:	
Copper, 40,000,000 lbs at 11c	$4,400,000
Silver, 1,200,000 oz. at 66c	792,000
Butte Reduction Company:	
Copper 5,000,000 lbs at 11c	$550,000
Silver, 400,000 oz. at 66c	264,000
Gold, 1,500 oz. at $20	30,000
Butte & Boston:	
Copper, 23,000,000 lbs at 11c	$2,530,000
Silver, 345,000 oz. at 66c	227,700
Montana Ore Purchasing Company:	
Copper, 16,000,000 lbs at 11c	$1,760,000
Silver, 640,000 oz. at 66c	422,400
Parrot Copper and Silver Company:	
Copper, 12,000,000 lbs at 11c	$1,320,000
Silver, 2,200,000 oz. at 66c	1,452,400
Gold, 5,000 oz. at $20	100,000
Colorado Company:	
Copper, 6,000,000 lbs at 11c	$660,000
Silver 75,000 oz. at 66c	495,000
Gold, 4,500 oz. at $20	90,000
Butte Sampling works:	
Gold, silver and copper (etc.)	$500,000
Total output for 1895	$29,772,500

THE LIVERPOOL.—Lump Gulch *Miner:* This stand-by property of Lump gulch has been partially closed down during the past week, the proprietors having come to the decision, last Monday morning, to do no more dead work in the mine until some time in the future—possibly next spring—and in consequence twenty-two men were laid off, leaving only a force of twenty-one men employed on the property. This force will be kept steadily at work stoping out ore now in sight, and working out the levels down to the 400. It is to be regretted that the proprietors of this property should have come to this decision just at the beginning of winter, and they probably have reasons for it of which we are ignorant. At the present price of silver there is not much to encourage the mining man to open new ground by sinking to greater depth in property already opened, or by trying to find new mines and exploit them. In the case of the Liverpool, as well as in all the other mines shipping ore from this gulch, and in this entire mineral district for that matter, there would be nothing doing at all, were it not for the exceeding richness of the product.

THE KATIE MINE AT BASIN.—James Glass, manager at the Katie mine, has disposed of a one-third interest in the property to Springfield, Mass., capitalists, who will build a 500-ton mill and probably a smelter.

There is a report that there is a deal under way by which the Hope at Basin may soon change owners. Prof. Park, the expert, who recently examined the mine, has gone to New York City, to report to the capitalists who have in view the purchase of the property.

A GOOD SHOWING.—Montana listed mines paid in dividends during the month of November the sum of $800,000. Up to and including November of this year, the listed mines of the State—ten in number—have paid the sum of $1,654,140. This does not include the Anaconda, which paid more than all the others put together. It is estimated that the mineral output of Butte this year will be $31,000,000.

UTAH.

MERCUR ARSENIC.—*Tribune:* The arsenical ores of Mercur and of Sunshine, toward which so much antipathy has developed by reason of their repugnance to the cyanide process, now promise foundation for another branch of the mining industry as important, perhaps, as any within it; and the time is not distant when an arsenical product must figure in the output of Camp Floyd mining district.

There is not a mine in Mercur or at Sunshine in which the presence of this mineral upon one level or another is not revealed. While their occurrence in some are greater than in others, the fact of their presence is none the less positive.

A grave question with some has been as to how to extract the values from the ore in which the arsenical property occurs, the average miner, however, attaching no value to the arsenic. It has long been known that the roasting of the ores in which the repugnant property appeared would expel it, but the expense of roasting, it was pleaded, was greater than in the auriferous property of the ore with which it was associated. Hence it is that the arsenical ores have been shunned and large bodies allowed to lie idle while the search went on for the oxidized bodies.

In the laboratories at the various mines the struggle has been to overcome the arsenical objection. On an experimental scale it is now ascertained that not only can that be accomplished, but that the arsenical product, which possesses commercial values far above the average mineral, can be made to pay the expense of extracting the gold and yield a handsome profit to the owner.

The means for doing this goes back to the roaster, the only addition being the chambers, into which the arsenical fumes are passed and in which the product is condensed, subsequently refined and made a commercial product to serve the arts and sciences. Recent experiments have disclosed these facts, and while the movement looking to the arsenical ores in the manner just described is yet in its infancy, the gentlemen who are promoting it have abundant means with which to subject the discovery to a practical test. Should the results prove satisfactory, steps will be taken at once to put up a plant for the treatment of arsenical ores, the projectors believing the supply now lying idle in the bonanzas sufficient for immediate wants, and relying on the disclosures of the future to render it as permanent as are the other branches of a great industry.

It is generally known, too, that where the arsenic has appeared the auriferous values of the ore have improved—another of those incomprehensible decrees of nature—and while overcoming an element with which the cyanide has so stubbornly refused to affiliate, the average value of the output of Mercur and Sunshine should be accordingly improved.

BEAVER-WALRUS INCORPORATION. — G. B. Norman, Park City; A. G. Lamson, Boston; T. Marshall, J. E. Gnligher, J. W. Moffatt, C. T. Stevenson, of Salt Lake, form the Beaver-Walrus Mining Company. Capital stock, $500,000. Property consists of the Beaver, Walrus and Cottontail claims in West Mountain mining district, Salt Lake county.

COLORADO.

LA PLATA DISTRICT. — (Special correspondence).—In the spring of '94 a boom struck the mountains, which did more harm than good, causing an influx of that class of prospectors who are quick at locating and recording but abhor work as something out of the question. Now that class has gone, and the prospectors left have settled down to hard work.

The ores of La Plata mountains are chiefly low grades in big veins. The gold is associated with iron, which in many instances has oxidized so as to leave the gold in a practically free state. A few locations carrying copper or galena have been or are worked on the west side of La Plata river, but in these the percentage of the baser metals is low and the valuable metals seemingly replaced, rendering the claims unprofitable for working. At the head of La Plata river the silver values predominate, the veins carrying but little gold. Extensive works here show that some years ago silver mining was carried on on a large scale, but now the mines are shut down and the works closed.

Here, as in any other camp that has a history, one can see monuments of early mistakes in the form of mills unsuitable for the ores. There are four or five of these witnesses. Sometimes the mill was built before the ore was found, as in the case of the Oro Fino mine, where $40,000 or more are thrown away; or the kind of mill was shown to be the wrong one, as the Comstock and Lewis mines. The Cyanide mine, on Junction creek, as it now stands, idle and encumbered with attachments, on the other hand, goes to prove that bad management can ruin and make unprofitable the best of processes. The mill is owned by a Lancaster, Pa., company, who also own the Western Belle mine, on Junction creek slope of Mt. Lewis. Here the mistake was made in sending out men to manage the business who knew positively nothing about mining or milling and who were too old or too adverse to learn, and the consequence naturally was, instead of dividends, a complete failure.

The ores are low grades and cannot bear the charges of transportation to and treatment by the Durango smelters, but now, with the treatment charges reasonable and transportation two or three miles instead of twenty-six or more, many properties heretofore impossible to work will now pay well. A saving of $8 to $12 per ton on ores running $25 to $30 per ton is a great item. The Trashler mill has greatly stimulated mining in the La Platas. There are, however, properties not depending on the success of this mill that are being worked.

The Columbus, in Silver Lake basin, is a representative property. It was discovered about three years ago and has been quietly prospected by intending purchasers. The deal is now closed and the work on the property is going on, in sinking shaft and erecting necessary buildings for the housing of men and machinery. The vein on this property is about sixteen feet wide, carrying an average value of $34 per ton. A shaft was sunk 40 feet along the hanging wall last fall, and a mill-run sample from the width of the shaft, or five feet, gave the astonishing result of $300 per ton. The new owners will sink 600 feet and otherwise prospect the property as fast as machinery and men can do it. C. L. Wright is general manager and Jim Montgomery, an old timer, has charge of the mine.

Another property is the Mountain Lily, on the west side of the river. It is owned and worked by D. Shively. Like the foregoing, the ore is tellurium, although of different character. The vein is not more than two or three feet, with a pay streak of six to eight inches. It is quite extensively developed for a prospect and has shipped some good ore, while all indications point to better results.

The Durango Girl, in Waus gulch, on the Junction creek slope, is another tellurium vein, different from the above. The location is comparatively low in a porphyry dike, which cuts through the sedimentary formation in an east and west course. The vein is from two to two and one-half feet wide, consisting of silicous lime and quartz in which the tellurium is found in a solid streak from one-quartor to five inches wide. It is worked by an adit 300 feet long.

A property of different character is the Little Kate, in Basin gulch, on the west side of La Plata river. The ore is here (near the surface, at least) free milling. By several tests it has been demonstrated that about $10 per ton can be saved by amalgamation, and as there is an immense body of such ore, the owners have concluded to erect a 20-stamp mill near the property. Too little work has been done to see whether the ore continues to be "free milling" as depth is gained, but it would certainly be reasonable to suppose that it cannot be the case.

The Baker Contact properties, in the Tiburcio gulch, on the east side of La Plata river, is about the same kind of proposition, differing only so far as the preceding is a vertical vein and the Contact a horizontal vein, with the vein matter of different rocks.

Down in Burnt Timber gulch is a group of prospects on which development is going on. The ore is here, as in the foregoing, iron sulphide disseminated through a big porphyry dike, in which the process of oxidation has penetrated as far as development has progressed. So, like the foregoing, the gold may near the surface be saved by the amalgamation process, but is sure to change when a certain depth is gained.

At the head of Lightner creek are several good prospects, which with some development would probably turn out well. The veins are strong and well defined, and traceable for a long distance. The ores are galena and tellurium with sulphurets of silver mixed in a quartz gangue between porphyry walls.

The above enumerated are only a few of the over one thousand claims in the district, but are taken as showing the different ores and being more developed than the rest.

Several attempts have been made in placer mining along the La Plata river and tributary gulches, but so far without any success. The reason for this failure is not hard to find, when it is known that none of the leads so far discovered carry free gold, but that it in every instance is associated with some base metal. Of course some gold is carried down the gulches from the oxidized surface ores, but not in quantity enough to pay the placer miner. The gold in this way eliminated is also generally too fine and too light to be saved in the boxes.

While the La Plata mountains do not claim any strictly free-milling ores, its large bodies of low-grade refractory ores will some day be handled with profit.

So far only a few larger companies are operating, but with the influx of needed capital and the surface workings replaced by deeper mining, many now worthless prospects will become paying mines.

Durango, Colo., Dec. 21, 1895.

The following is the output of Creede mines for the year 1895 as near as can be given. The output for December is estimated and added to the returns up to December 1st:

Tons of ore	60,011.00
Ounces of gold	6,630.80
Ounces of silver	2,461,652.50
Tons of lead	3,727.20
Tons of zinc	122.00

AT WARD.—The Columbia has started up again under Superintendent Parmeter, paying $3 a day, all differences over wages having been settled.

HALF INTEREST IN THE BELDEN MINE SOLD.—A one-half interest in the Belden mine at Gilpin, in Eagle county, is sold for $600,000 by A. A. Macdonald to New York and Brooklyn purchasers. This is the largest sale made in that section of the State for a number of years. It is claimed that the reports of experts to the new purchasers are to the effect that $7,000,000 worth of ore is in sight.

NEW MEXICO.

PINOS ALTOS. — Spiller and McLean are working 25 men on the Pacific Company's claim. The ore is being hauled to the company's mill at Silver City and keeps 20 stamps constantly at work, with good results in gold bullion.

MOGOLLON.—The Colonial Company is employing 14 men on the Last Attempt mine and 26 men on the Maud S. The two mines furnish sufficient ore to keep the mill running steadily.

The Confidence is producing 70 tons per day, which is reduced at the mill, turning out $30,000 per month in gold and silver.

ARIZONA.

A *Globe* paper reports that the Old Dominion Copper Mining and Smelting Company blew in the first furnace last Wednesday. Supt. McLean has 100 men employed in development work. The three compartment shaft is down about fifty feet below the eighth level. The stopes on nearly all the levels look well, and can easily supply ore to keep three furnaces running.

Yuma *Sentinel:* The report of Manager R. M. Reymond states that the cyanide plant was run steadily during the month, and operations progressed very smoothly. The wire tramway has handled the pulp easily and very satisfactorily. The lumps of slimes and layers of these in the beds gave some trouble, but arrangements are being completed to make the treatment of these more satisfactory. During the month the storage water tanks were moved from the stamp mill to a considerable elevation above the cyanide plant, and a good pressure and supply thus secured for sluicing the pulp from the vats after treatment. The mine water is also pumped to these tanks and used for sluicing. Two men on the night shift sluice out the residues very readily. Sluice boxes from the vats were put in, and a canvas roof put over the ore vats, which keeps them in better condition. The precipitation in the zinc boxes has been very satisfactory. They have been rather crowded and the box intended for the waste solutions had to be used for the stock solutions. Another box will be put in at once, and the low solutions running to waste will first be passed through this. The amount trenting and the returns are as follows: Pulp treated, 3,973 tons; assay value of pulp $4.10 per ton; assay value of residue, $0.78 per ton; proportion extracted according to assays, eigthy-one per cent; according to bullion, seventy-six per cent; gold precipitated, $12,000; cost of treatment, $5100; extraneous expenses, $1100; balance, $5800. Adding miscellaneous revenue, $300, the net profit for the month was $6100.

YAVAPAI COUNTY.

Journal-Miner: Joseph Meyer is running five stamps of the Henrietta mill. During a twenty-four hours' run recently he took out seven pounds of amalgam from the plates the product of these five stamps. As soon as some repairs can be made to the machinery five more stamps will be started up.

THE UNITED VERDE.—Jerome *News:* The United Verde Copper Company is a close corporation and the public know nothing of their inside workings; but there is no necessity of the hooks of the concern being opened to the public, as a trip through their smelters and over their trails, and the fact that they carry from 500 to 700 men on their payroll, will satisfy the most skeptical that there is a most wonderful mineral vein in this mining district. Again, the report is, and it has been said that the report is undoubtedly true, that this mine netted $3,500,000 for its owners last year. There can be no value placed on this property by those outside of the company, and the owners will not name a price, even if they are capable of so doing, and it is doubtful if there is any person, excepting perhaps Joseph L. Giroux, the superintendent, who has any idea of how much money these mines are really worth. Last week, while the Standard Oil Company's mineral experts were in Jerome, they were asked why they did not take a look over the United Verde Company's plant. They answered that there would be no use, as their company had asked Mr. Clark to name his price, but had been told the plant was not for sale.

LOWER CALIFORNIA.

A wealthy mining man of San Diego, lately returned from the mining camps of Lower California, says there are miners who would put off to Africa or some other distant country if they thought they would find a good mine when they got there, but that there is no comparison between Lower California and that other country as regards mineral wealth and the ease and convenience with which placers or ledges may be worked or developed. The quartz mines at Jacalitos and other camps in that part of the country are promising, and prominent men of Ensenada are largely interested there. W. E. Howard of San Diego and a company of Los Angeles men are about to begin operations on 500 acres of placer ground there, and will spend $15,000 in getting under way. There is the greatest harmony existing between the Mexican officials and the Americans on the peninsula.

TO WORK THE JUAREZ PLACERS.—*Lower Californian:* P. L. Griffin, the president and manager of the Pyramid Mining Co., a Los Angeles corporation, arrived in Ensenada on the Pacheco Tuesday morning. He came down for the purpose of paying the Mexican Government $2310 on the 231 mining pertenencias or placer claims—at the rate of ten dollars per claim—which he denounced for his company four months ago in the Juarez district. This is the largest sum of money ever paid into the Government by a mining company at one time in this section, and as there were not sufficient stamps in the local stamp office for the patents an order had to be telegraphed to the City of Mexico.

The claims of the Pyramid Co. occupy about 800 acres, embrace a small valley and include some of the best placer ground at Juarez. A creek, in which a continuous stream flows, runs through a portion of their property, and from this stream they propose to develop their water supply. A large amount of money will have to be expended and a great deal of work done before they can begin separating the gold from the gravel, but the promoters have no misgivings as to the ultimate results of the enterprise.

Improved Ore Concentrator Belts. PATENTED.

RIFFLED OR SMOOTH.

Suitable for all Ore Concentrating Machines in General Use.

These belts, with slight riffles at intervals, *will save* a greater percentage of valuable concentrates *than any other vanner belt.* Our new style flanges on the edge of the belt make it much more durable than any other. Send for circular and price list.

THE BLASDEL IMPROVED ORE CONCENTRATOR BELT CO.,

H. G. BLASDEL, Jr., Manager. Cable Address: BLASDEL. Haywards Building, 419 California St., San Francisco, Cal.

RISDON IRON WORKS,

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.
SAN DIMAS DURANGO, MEXICO, October 25, 1895.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 6 mesh screen. Our mills run 85 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons, and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1800 tons.

One set of tires will crush 1500 tons.

One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to slimes, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail, over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec'y.

BULLION-BECK AND CHAMPION MINING COMPANY
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

R. R. TAWNDRAW, Esq., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months, and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

Coast Industrial Notes.

—The narrow-gauge road between Colfax, Grass Valley and Nevada City has made a general reduction in fare.

—The creosote plant at Ballona, through which the piling at that place was treated with creosote, is to be removed to this city.

— The University of California will shortly expend $250,000 in the erection of three buildings for the use of the affiliated colleges in the western part of San Francisco.

—The merchants of Seattle, Wash., have made an offer to the Hawaiian planters. They are willing to furnish a site for a sugar refinery, remit State and county taxes for a term of ten years, and offer other inducements. The idea is to ship raw sugar to Seattle and refine it there. The vessels would return with merchandise or freight.

—The work of building two new composite gunboats for the United States Navy has been begun by the Union Iron Works. They are twin-screw steamers, 174 feet in length, 34 foot beam, 12-foot draught, engines 800 horse-power, speed 12 knots. Each will carry 6 four-pound, 4 six-pound and 2 one-pound rapid fire guns

— The rate war to Portland between the Southern Pacific and the O. R. & N. which has been in progress about a month is ended. The Southern Pacific officials here decided to advance rates from this city to Portland on the 25th and from Portland to San Francisco on the 24th ult. The first class rate of $10 will be raised to $15, and the second-class rate of $5 to $7.50.

—The Harbor Commissioners have awarded contracts for the work on the new Union Depot at the foot of Market Street, this city, as follows: C. F. McCarthy, stonework, $230,000; steel and cast-iron work, Risdon Iron Works, $188,000; carpenter and glazing work, Bateman Brothers, $48,400; plumbing and gas fitting E. J. Duffy, $11,123; roofing, etc., Wm. Cronan, $43,999; painting, George Smith & Son, $12,900.

— A dispatch from the city of Mexico says A. C. Butler of South Africa has arrived there with a letter of credit of $15,000,000 from Barney Barnato and Cecil Rhodes of South Africa. It is said that he has made an investment of several million dollars in the drainage tunnel which the Government has under way and in the city waterworks and has also taken an option upon the street railway system for $7,000,000, and is attempting to buy up the copper properties in the country. There is probably as much truth in this as in the similar statement that Barnato was going to immediately invest $15,000,000 in Cripple Creek, Colorado, properties.

—The Interstate Commerce Commission has announced its decision in the case of the Colorado Fuel and Iron Company against the Southern Pacific Company, and others carriers, relating to the legality of rates on steel rails and other iron and steel articles from Pueblo, Colo., to San Francisco. The complainant alleged that an unreasonable charge of $1.60 per 100 pounds was made on these articles, while the rates from the East were much less. The Commission held that the rates complained of were unreasonable and unjust, and ordered that the rates from Pueblo to San Francisco should not exceed 45 cents per 100 pounds on steel rails and fastenings, and 37½ cents per 100 pounds on similar articles of iron, and that the rates shall never exceed 75 per cent of those charged on like traffic from Chicago to San Francisco.

Personal.

HENRY T. SCOTT has returned from Washington.

J. T. DONNELLAN is president of Salt Lake, Utah's, new mining exchange.

JOHN H. KLOCK, who has been in Chicago for three years, is again employed as assayer at the Blue Bell, Ainsworth, B. C.

HENRY SCHLUND, assayer and chemist for the Mountain Mining Co. of Keswick, Shasta Co., perished from exposure while out hunting on the 16th.

CONGRESSMAN S. S. AITKEN of Michigan has been appointed by Speaker Reed chairman of the Congressional Committee on Mines and Mining to succeed T. A. E. Weadcock of Michigan, the chairman of that committee in the 53rd Congress.

SEVERAL changes will be made in San Francisco in '96 in the station and duties of army engineers. Colonel Charles R. Sutte, member of the Mississippi River Commission, is made division engineer of the Pacific division, with headquarters at San Francisco, in place of Colonel Mendell, recently retired. He will be succeeded at St. Louis by Lieutenant-Colonel Amos Stickney, also a member of the Mississippi River Commission. Major William H. Heuer, in charge of the river and harbor work at Humboldt bay, has been transferred to Cincinnati as relief to Lieutenant-Colonel Stickney. Major C. F. L. B. Davis, now on duty at Washington, succeeds to the duties vacated by Major Heuer. Major Thomas H. Handbury, in charge of the works in Florida, will take the station at St. Louis as relief to Major Charles J. Allen, who succeeds Major Davis at Washington. Lieutenant-Colonel H. H. Benyaurd, now in this city, is ordered to relieve Major Handbury at St. Augustine, Fla.

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SOLDERING MACHINE.—Mathias Jensen, Astoria, Or., assignor of one-half to the Jensen Can Filling Machine Co. No. 551,122. Dated Dec. 10, 1895. This invention relates to that class of machines in which the cans are rolled forward by an endless chain while being soldered. Its object is to save solder and make neater work in soldering the end seams of round cans. It consists of a tank extending longitudinally along the supporting frame; a revoluble roller submerged longitudinally in the tank, so that its upper surface supports one end of the can, whereby the solder is applied to the end seam where the can rolls over it. The opposite end of the can is supported by the tank, and an endless chain is made to travel with its lower fold in contact with the upper surface of the can, so as to roll the can forward in a direction at right angles with the rotation of the soldering roller. A revoluble wiper is journaled in the path of the cans, so as to remove the surplus solder after they leave the soldering roller. A shield extends over the wiper close above the lower fold of the chain, to prevent the can being thrown out of place by the action of the wiper. The shaft of the soldering roller passes through the end solder trough or tank by means of a stuffing-box surrounding the shaft and filled with an indestructible packing material, which prevents the escape of the solder but allows the shaft to pass outward, where by suitable mechanism it and the roller are rotated. The wiper consists of a series of flexible leaves, and the arms of the wiper are provided with suitable adjusting devices.

SWITCH FOR UNDERGROUND ELECTRIC RAILWAYS.—Alfred Rosenholz of San Francisco, Cal., assignor of one-half to Samuel J. Clarke and Harvey S. Brown of same place. No. 551,145. Dated Dec. 10, 1895. This invention relates to a device which is especially applicable for use upon electric railways in which the conducting and trolley wires are carried along beneath the surface of the ground. The object of the invention is to provide an automatic means for cutting off the electric current in case the tube within which the parts are arranged becomes flooded so as to prevent the loss of electricity, and in a means for so actuating the switch that under ordinary conditions the current of electricity will be transmitted from the main conductor during the time in which a car is moving over the section of trolley wire which is thus energized. It consists of a stationary magnetic core projecting at right angles with the main conductor, a sealed insulated casing enclosing the core and movable with relation thereto about the main conductor, a trolley wire supported from the movable end of the casing and connected with a contact plate adjacent to the free end of the core, and means for making contact when the casing is depressed so that the electric current will be transmitted during the time when the casing is depressed, the casing being immediately tilted in the opposite direction as soon as the core leaves that portion of the trolley. The whole device is suitably insulated and a float is so connected with a locking arm that in case the tube or tunnel should be flooded with water the float would rise and throw the locking arm into engagement so as to prevent any movement of the casing to allow the passage of the electric current from the main conductor and consequent loss thereof.

SOLDERING MACHINE.—Mathias Jensen, Astoria, Or., one-half assigned to the Jensen Can Filling Machine Co. of Oregon, of same place. No. 551,491. Dated Dec. 17, 1895. This invention relates to improvements in soldering machines. Its object is to remove the surplus solder from the end seams of cans after being soldered by an ordinary soldering machine. It consists of a carrier for the cans, oscillating wipers in the path of the cans, arms carrying the wipers having shafts and springs acting on the shafts to hold the wipers in normal and yielding contact with the cans, and means whereby the arms may be moved and the wipers adjusted to and from the cans, and mechanism for operating the carrier. It also comprises a heating chamber in contact with which the cans move, so that the solder is prevented from becoming hard while it is being removed by the wipers.

DEPARTMENT OF THE REGISTRAR OF PATENTS, South African Republic.—Application for improvements in traction engines—Registered No. 1004 (official Dutch title verbeteringen aangebracht in locomobielen).

Notice is hereby given for general information that Daniel Best, residing at California, America, deposited on the 29th day of October, 1895, at my office, an application for letters patent for the invention above named, with specification relating thereto.

Now, whereas the said D. Best has given me written notice that he wishes to proceed with his application, I have decided that all objections thereto shall be filed at my office before Friday, the 14th day of February, 1896, at 3 o'clock P. M., after which time the Attorney-General will fix the date of bearing.

I therefore summon all persons interested in objecting to a patent being granted for the above named invention to the above mentioned D. Best to deposit with me a document clearly setting forth their objections before the aforesaid date, as they will otherwise be excluded from submitting the same.

Done this 29th day of October, A. D. 1895, at Pretoria, South African Republic.

(Signed) CARL VECKERMANN, SR.
Registrar of Patents.

BOOKS ON ASSAYING.
By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

BOOKS ON WORKING ORES.
BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

IMPROVED PORTABLE HOISTING ENGINES.

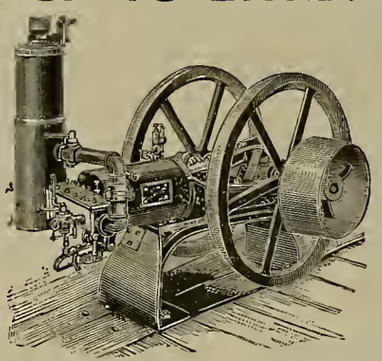
Improved Self-Contained Three or Five Stamp Mill,

Saves hill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.



FOURTH: The great saving of freight.

Send for Circulars and Price List.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY

BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 26, 1895.

The statements of last week apply with equal truth to the present status. The market is "slow and interesting." When all hands get through squaring up accounts prices will cease to recede and checked negotiations will be renewed after New Years. The talk of the past two weeks has had no more to do with it than the comet. It is the dull season, when few care to load up, and every merchant and manufacturer is taking account of stock. Silver is the steadiest of anything on the list. Conditions that affect the world of business have little influence on the accumulative propensity of the Orientals. As with silver, so with gold, so far as India is concerned.

Between 1859 and 1889, thirty years, or less than half one lifetime, India has absorbed £117,000,000 in gold and £227,000,000 in silver, or £344,000,000 in all. What has become of the silver no one knows exactly, though it is certain that a great proportion of it is hoarded as fixed and valuable wealth, but about the destination of the gold there is no doubt at all. The people have got the whole of it in their own hands, for it is not in circulation, and are using it either in ornaments, kept, be it observed, to pawn in extremity, or as hoarded treasure in coin such as lies under almost every peasant's floor in the Punjaub and Eastern Bengal. India is a treasure house of gold, yet a man may live 50 years in the British provinces and never see an ounce.

Mining Share Market.

SAN FRANCISCO, Dec. 26, 1895.

As usual to the mid-winter holiday season, business has been dull. Outside of cross-orders, legitimate transactions were light up to Monday when there was more doing, which resulted in fairly active trading on Tuesday at slightly higher prices. The up-move was confined largely to the shares of the mines working on the Brunswick lode. The strengthening of the market caused the more timid of the short-sellers to fill, proving that over Christmas still better things may be reported from the mines, which might provoke stronger buying and cause quite an advance along the entire line. While this is greatly to be desired, yet conditions do not seem to be favorable for a decided advance. The suits must be entirely out of the way before money-eyed men will venture in, for it is only human not to invest without first knowing there will not be any suits or chances for losing money through decisions of the suits now in court. How long these suits will hang, it is hard to say, but just so long the trading public need not expect anything more than false moves, which will early in next year be followed by assessments. The latter are always assured even if expected ore fails to materialize in sufficient quantity to admit of dividends. There is hardly a mine on the Comstock lode but is taking out more or less, and some high grade, yet the market hangs as if loaded down with lead. A few brokers and outsiders make spasmodic efforts to galvanize life into it, but after selling a few shares and getting some of the shorts to fill, they let go and the "let go" is worse than if no go had been made by them. Even activity in Colorado gold mining fails to enliven affairs, neither has the presence of the president of the Comstock Tunnel Co. Everything or anything that would have renewed active trading at advanced prices a few years ago fails in producing any effect now.

The news from the Comstock mines is to the effect that fairly good work is being done all along the line. In the Alta group there is no material change since last week's advices. The work is of a promising character, but there is too much promising and not enough of practical results in the way of finding a body of ore. In the Gold Hill group the work is still to the west in some, while in others work is being done to place them in better condition for more active work in 1896. In Overman, Belcher, Seg. Belcher, Crown Point, Yellow Jacket, Challenge, Confidence, Con. Imperial and Alpha the work is being closely watched, but it all points to time and more assessments. These mines are being put in splendid working condition for the 1896 campaign. The expected strike in Con. Imperial and Alpha is still abead. It is very much like bunting for the pot of gold to be found at the end of a rainbow. It is to be hoped that the strike will not vanish like rainbows and leave the runners for the pot out of breath and in this instance out of money. In Alpha they did make a strike, but it was a flow of water, but even the knowledge of this having been done is some consolation to the wearied assessment-racked public. It has always been claimed that a strike of a big flow of water is an evidence of being near to an ore body. It is to be hoped this will prove correct in this instance, yet Comstock mining is very uncertain. In Potosi, Chollar, Hale & Norcross and Savage ore is found, but not in sufficient quantity to meet current expenses. In Gould & Curry and Best & Belcher the work is essentially unchanged. Con. Virginia reports fair prospects on the several levels, but nothing to excite the cupidity of traders. The work is both exploiting and dead work. In Ophir, Mexican, Union and Sierra Nevada experienced miners seem to be interested in the work under way. But this has been the case for two or three years past without anything of importance being found. Hopes deferred maketh the heart sick, and in this instance it makes both the heart and the pocket sick. Some day, if the work is prosecuted, they are liable to stumble onto a body of ore, and when it is least expected. This has been the history of the Comstock mines, and they say history repeats itself; whether it will with these mines is, as yet, an open question, but assessment repeats itself every little while. Andes is almost forgotten, as is West Con. Virginia. Better things were expected of them.

To the Brunswick lode attention is again being centered, but with little success so far as promoting a boom is concerned. In Occidental on the 750-foot level a strike is reported to have been made, but it will take some time and considerable work to find out what it amounts to. As is the usual case, it was unexpected. Work in the ground owned by Chollar and Hale & Norcross is said to be quite interesting, and good things, aside from assessments, are looked for by some of the miners, but when is the conundrum. Very little is heard from the work going on in the ground owned by the Savage, Con. Virginia and other companies owning ground on the lode.

From the Bodie district nothing new or interesting comes to hand. The big things so confidently looked for about two years ago have not materialized, but steady work is being done in a small way.

The following illustrates the changes of the week:

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Joe G. De Bons in the Kerr mine, near Yankee Jims, Placer county, to impound tailings in Devil's canyon; from L. M. Sherwood et al. in the Sherwood & Snyder mine, near Chinese Camp, Tuolumne county, to impound tailings in Moccasin creek; from Henry A. Hallsted to the Clay Bank mine, near Meadow Valley, Plumas county, to impound tailings in a ravine; from W. H. Gleon & J. H. Hayden in the Blue Gravel mine, near Rancheria, Amador county, to impound tailings in Rancheria creek; from J. F. Evans in the Emma Harding mine, in Cook's canyon Plumas county, to impound tailings in a swamp; from John Smith in the Roman mine, Mountain Meadows, Lassen county, to impound tailings in a swamp; and from Wiley Sexton in the Kendall mine, near Grizzly Flat, El Dorado county, Cal., to impound tailings in Dogtown creek, gives notice that a meeting will be held at room 92, Flood building, San Francisco, Cal., January 13th, 1896, at 1:30 P. M.

SPECIAL MEETING.—A SPECIAL MEETING of the stockholders of the Sonora Extended Mining Corporation will be held at the office of the company, 213 Jackson street, San Francisco, California, on MONDAY, the 30th day of December, 1895, to consider and order on an offer to purchase the plant of the mine and other property of the corporation, and to authorize and empower the directors to sell the same, and to execute or cause to be executed a proper deed of conveyance of said property to the purchaser.

JOHN METCALFE, President.

Assessment Notices.

CON. CALIFORNIA & VIRGINIA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 22d day of November, 1895, an assessment (No. 5) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the sixteenth (16th) day of January, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 48, Nevada Block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of December, 1895, an assessment (No. 21), of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

HITE GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the seventeenth day of December, 1895, an assessment (No. 2) of 10c (ten cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, Room 27, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of January, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 10th day of February, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. E. MATHEWS, Secretary.

Office—Room 27, 120 Sutter street, San Francisco, California.

CALIFORNIA STUMP PULLER.

This is a photograph of the Stump Puller at work on redwood stumps on the farm of C. E. Ogburn, Guerneville, California.

In the improved form in which it is now offered to the public, it is universally admitted to be the most practical, powerful and successful machine of the kind in America, and the only machine in existence that can be successfully operated on hill land.
